Designing Microsoft Azure Infrastructure Solutions

Guten Morgen!

AZ-305 Agenda

Module 01 Design a governance solution

Module 02 Design a compute solution

Module 03 Design a non-relational data storage solution

Module 04 Design a data storage solution for relational data

Module 05 Design a data integration solution

Module 06 Design an application architecture solution

Module 07 Design Authentication and Authorization Solutions

Module 08 Design a solution to log and monitor Azure resources

Module 09 Design a network infrastructure solution

Module 10 Design a business continuity solution

Module 11 Design a migration solution

Design an application architecture solution

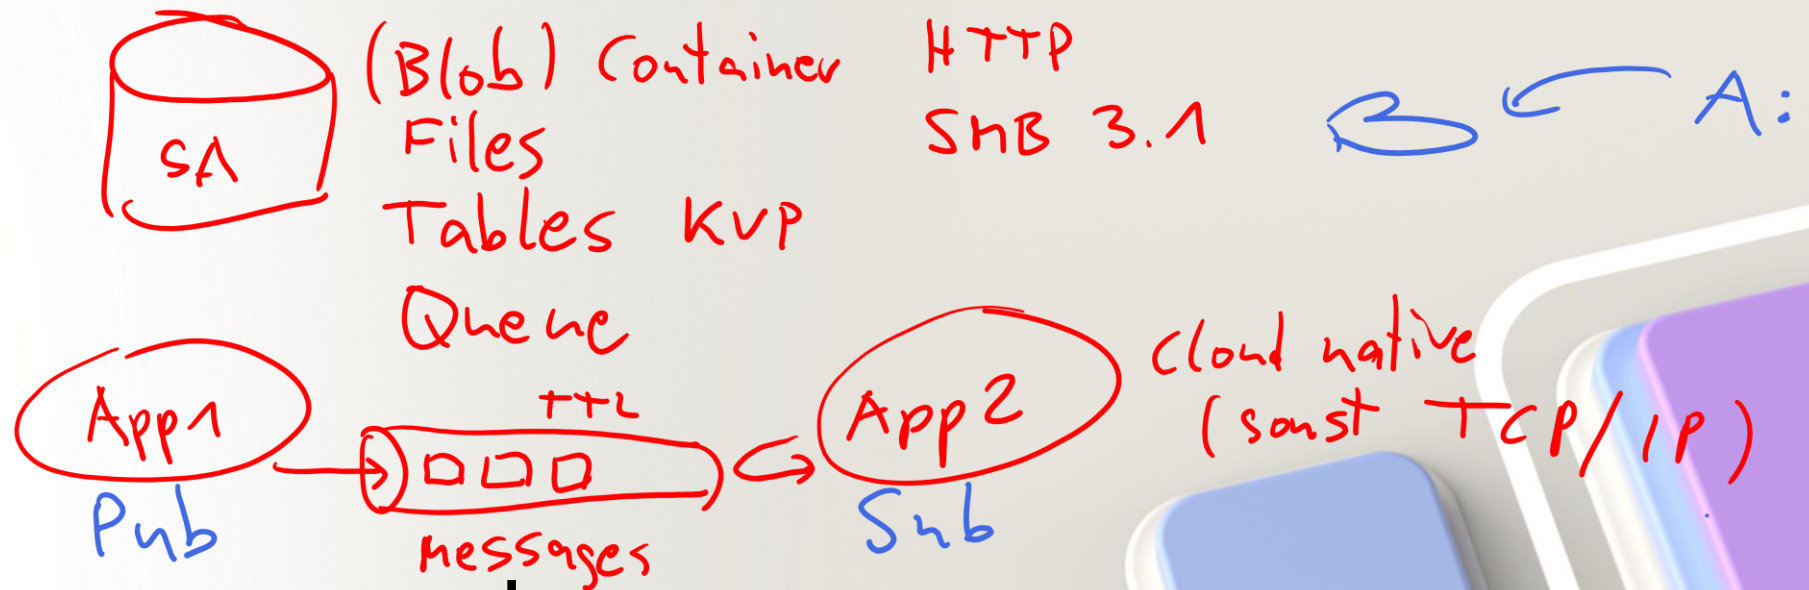

Learning Objectives

- Describe message and event scenarios
- Design a messaging solution
- Design an event solution (Event Hub and Event Grid)
- Design an application optimization solution
- Design application lifecycle
- Case study
- Learning recap

AZ-305: Design infrastructure solutions
(30-35%)

Design an Application Architecture

- Recommend a messaging architecture
- Recommend an event-driven architecture
- Recommend a solution for API integration
- Recommend a caching solution for applications
- Recommend an application configuration management solution
- Recommend an automated deployment solution for applications

Describe message and event scenarios

Buffer

Service Bus
FIFO

Determine message and event scenarios

Does the sending component expect the communication to be processed in a specific way?

Action	Description	When to use
<u>Event</u>	<ul style="list-style-type: none">• Light weight• Includes a publisher and a subscriber	Used for broadcasts and are often ephemeral. Ephemeral means the communication might not be handled by any receiver <u>if none is currently subscribing.</u>
<u>Message</u> Message Broker	<ul style="list-style-type: none">• Contains <u>raw data</u>, produced by one component, that will be consumed by another component.• Contains the data itself, not just a reference to that data.	Used where the distributed application requires a guarantee that the communication will be processed.

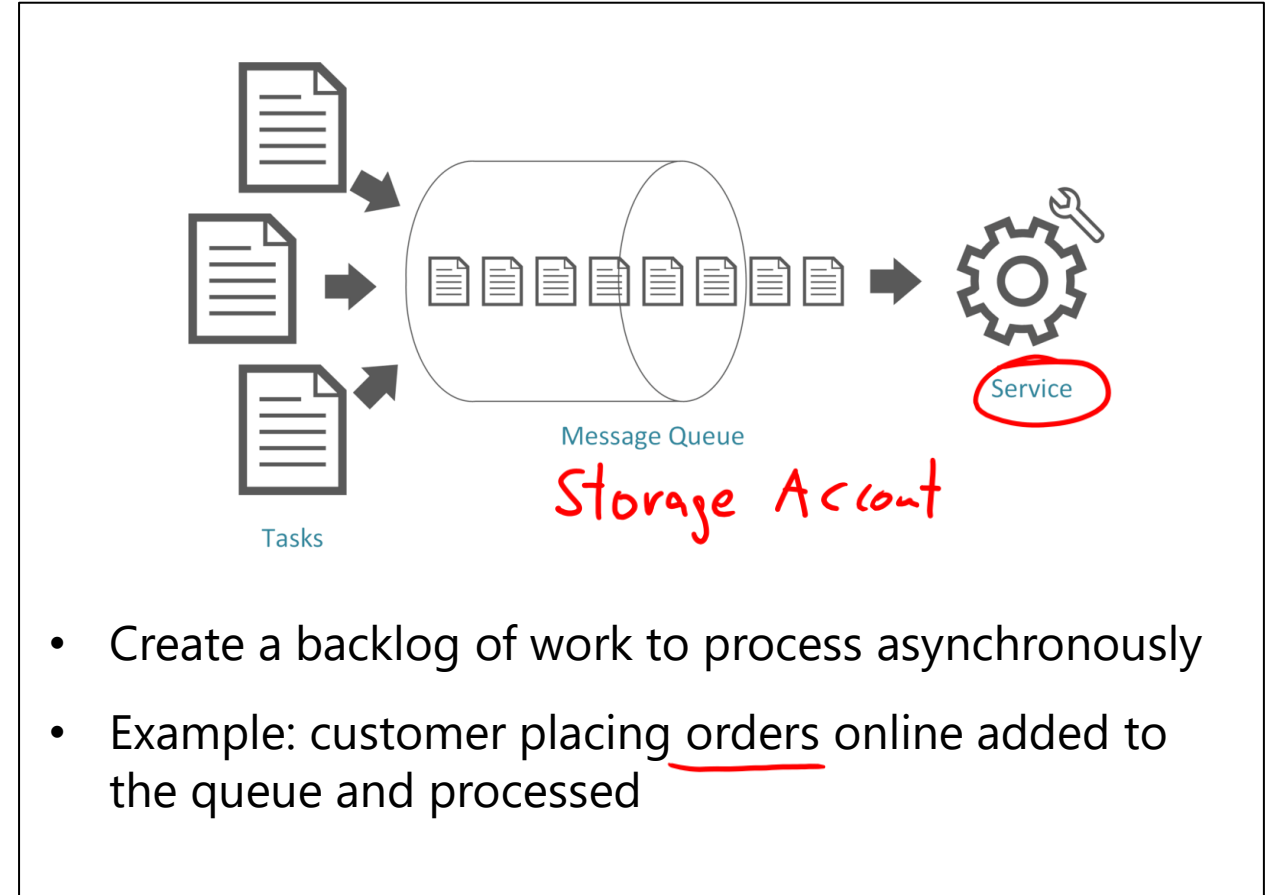

Design a messaging solution

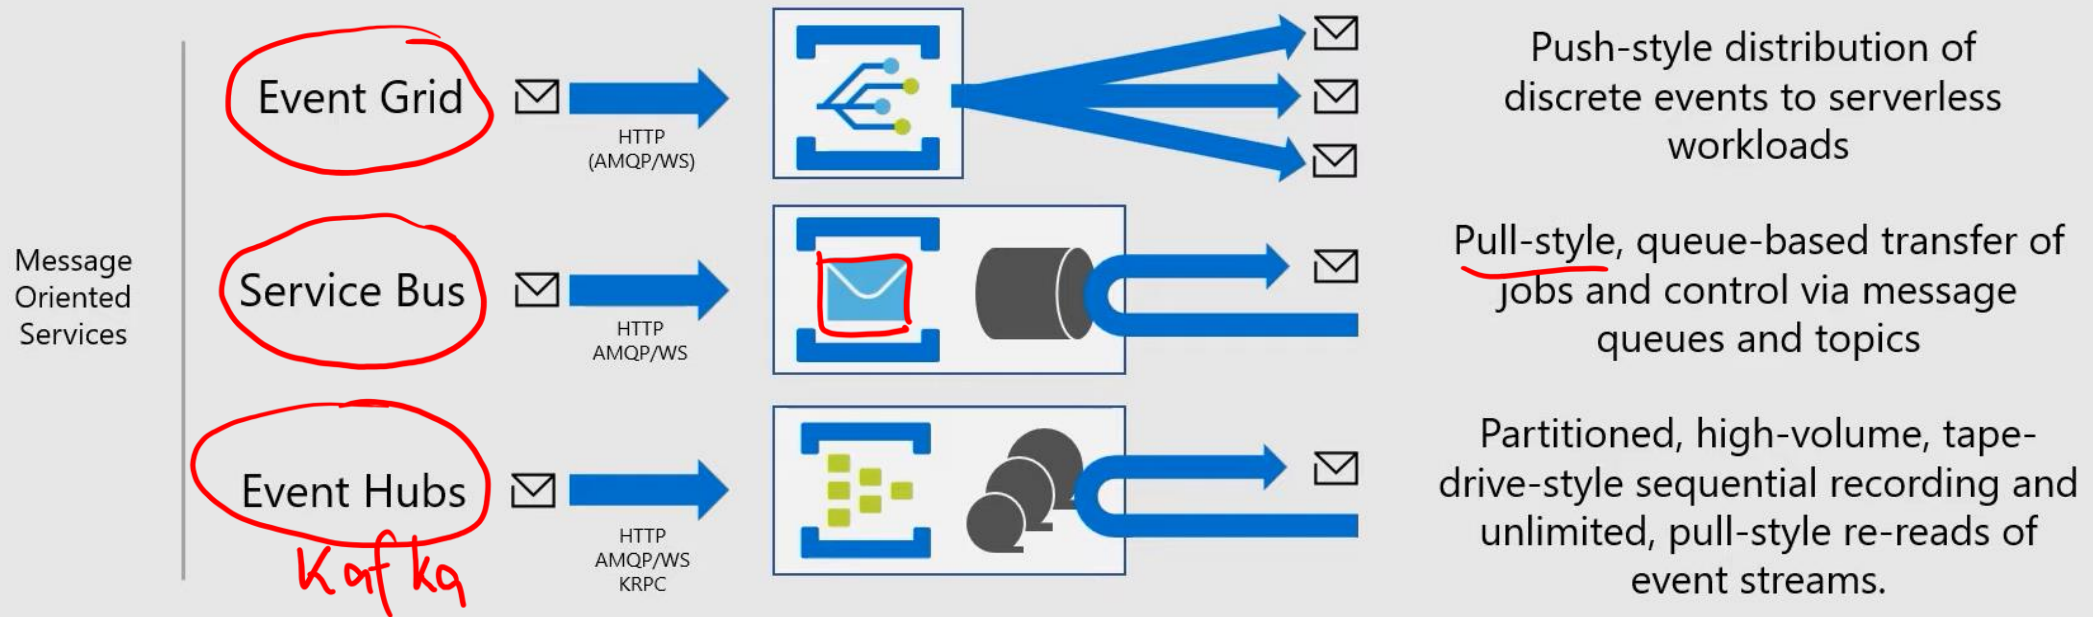

Design for Azure Queue storage

Azure Storage Queue is a service for storing large number of messages.

- Accessed with authenticated calls using HTTP or HTTPS
- Messages can be up to 64 KB in size
- May contain millions of messages, up to the total capacity limit of a storage account

Azure Eventing and Messaging Core Services

Service Bus Architectural Patterns

FIFO

Dead Letter Queue

- Assignment of work with load-aware balancing
- Load-leveling for "spiky" workload traffic shapes
- Transactional, once-and-only-once processing
- Multiplex handling of in-order message sequences
- Deduplication, deferral, and "poison" handling
- All of the above, plus:
- Copies to 100s of concurrent subscribers
- Filter rules and message markup
- Message routing

Service Bus is a "swiss army knife" for messaging-driven workloads.

Design for Service Bus queues and topics

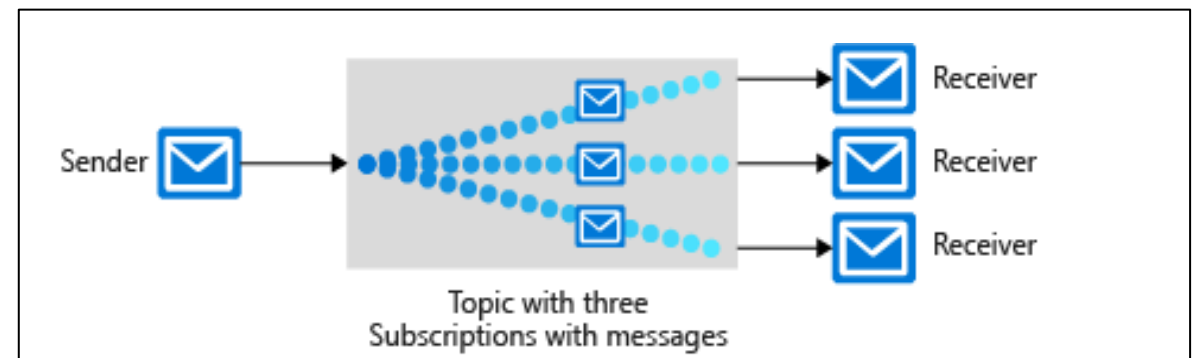

Service Bus decouples applications and services from each other.

Service bus queues

- Built on top of a dedicated messaging infrastructure
- Holds messages until the target is ready to receive them – different from queues

Service bus publish-subscribe topics

- Like bus queues but with multiple subscribers
- When a message is sent to a topic, multiple components can be triggered to perform a task

Compare messaging solutions

Solution	Usage cases	SLA
Queue storage	<ul style="list-style-type: none">• A simple queue to organize messages.• Queue to exceed 80 GB in size.• To track progress for processing a message inside of the queue.	Based on storage tier
Service bus queues	<ul style="list-style-type: none">• A first-in-first-out guarantee.• At-Least-Once message processing (PeekLock receive mode)• At-Most-Once message processing (ReceiveAndDelete receive mode)• Can group operations into transactions• Receive messages without polling the queue.• Publish and consume batches of messages.	99.9%
Service bus <u>topics</u>	<ul style="list-style-type: none">• Multiple receivers to handle each message.• Multiple destinations for a single message.	99.9%

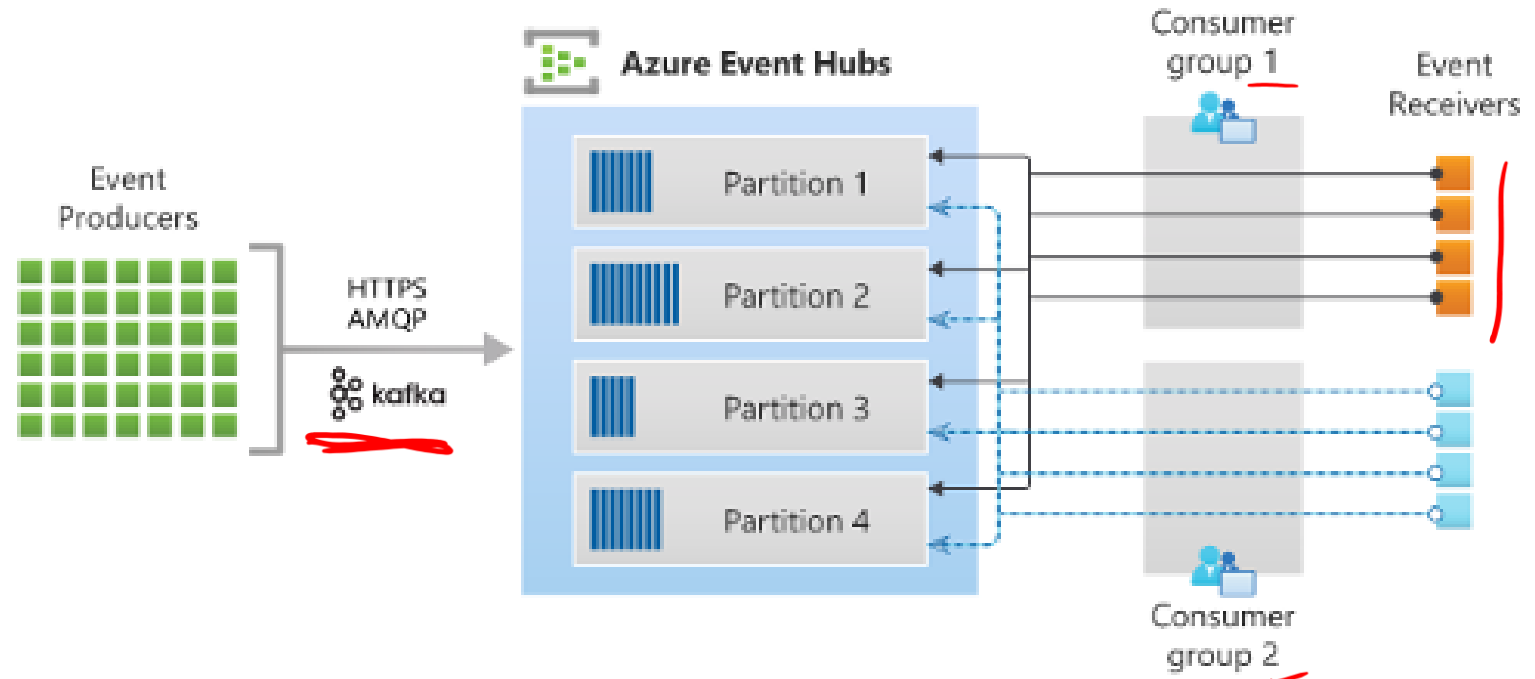

Design an event solution

Design an Event Hub messaging solution

Azure Event Hubs is a fully managed, real time data ingestion service

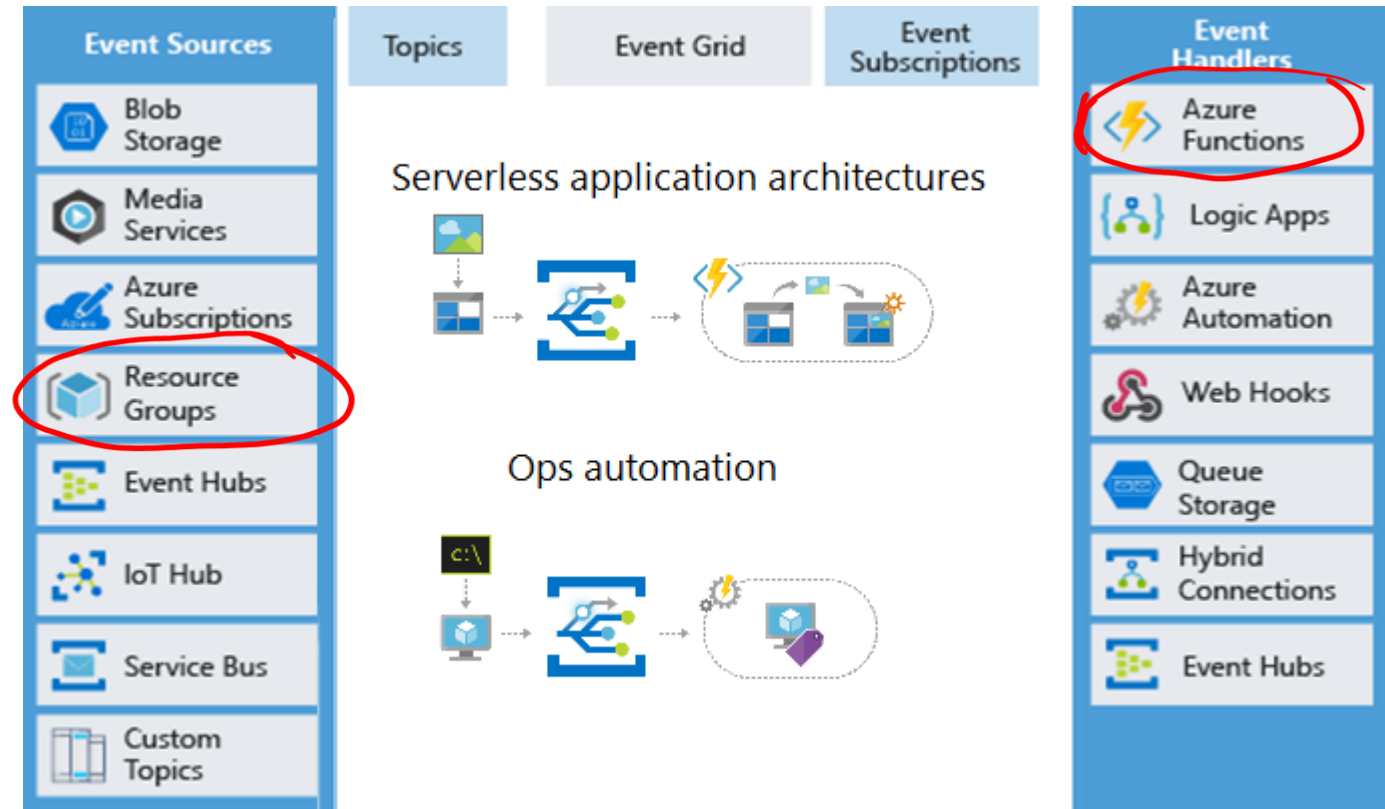

- Orders events by when they are received - by time offsets
- Uses a pull model allowing multiple reads from consumers
- Scaling is controlled by how many throughput units or processing units you purchase
- Receiving real-time streaming data

Design an event-driven solution

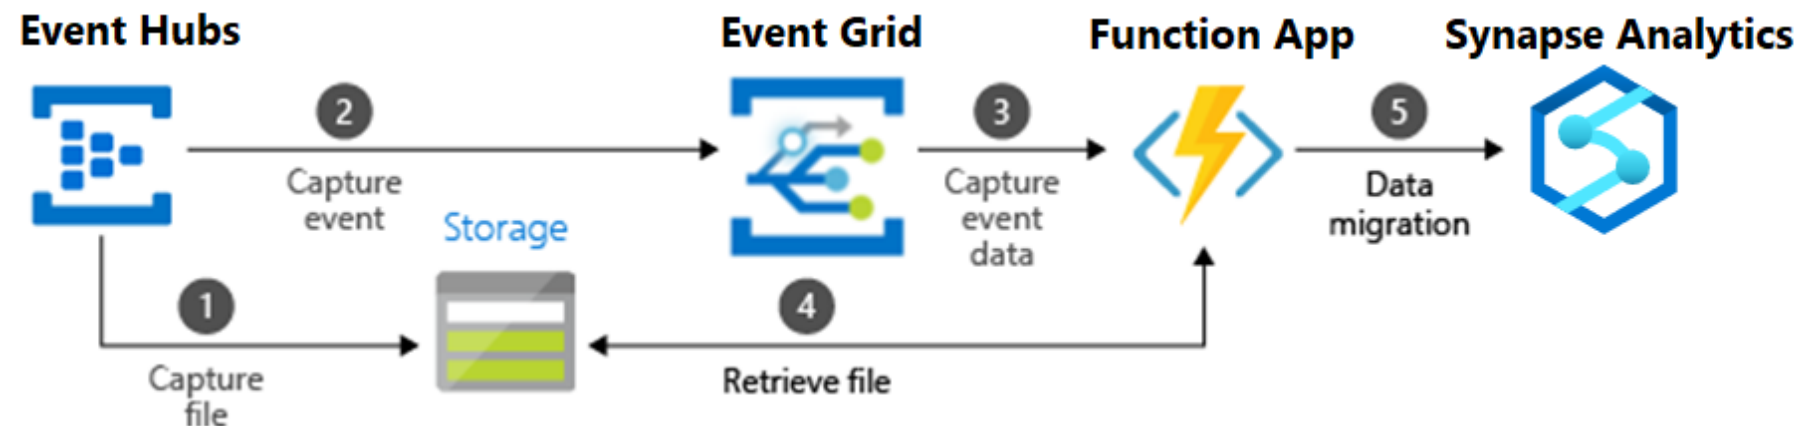

Azure Event Grid is a routing service connecting data sources with event handlers.

- Events sources include Azure resources or custom topics (you create)
- Event handlers react to an event
- Useful for serverless applications and operations automation
- Uses a pay-per-operation or pay-per-use pricing models

Comparison of message and event solutions

Consider combining several solutions

Service	Purpose	Type	When to use
Event Grid	Reactive programming	Event distribution (discrete)	React to status changes
Event Hubs	Big data pipeline	Event streaming (series) <i>real time</i>	Telemetry and distributed data streaming
Service Bus	High-value enterprise messaging	Message	Order processing and financial transactions
Storage Queues	Large-volume messaging queues	Message	Cost-effective, simple messaging mechanism

Paas

SaaS

Design an IoT Hub solution

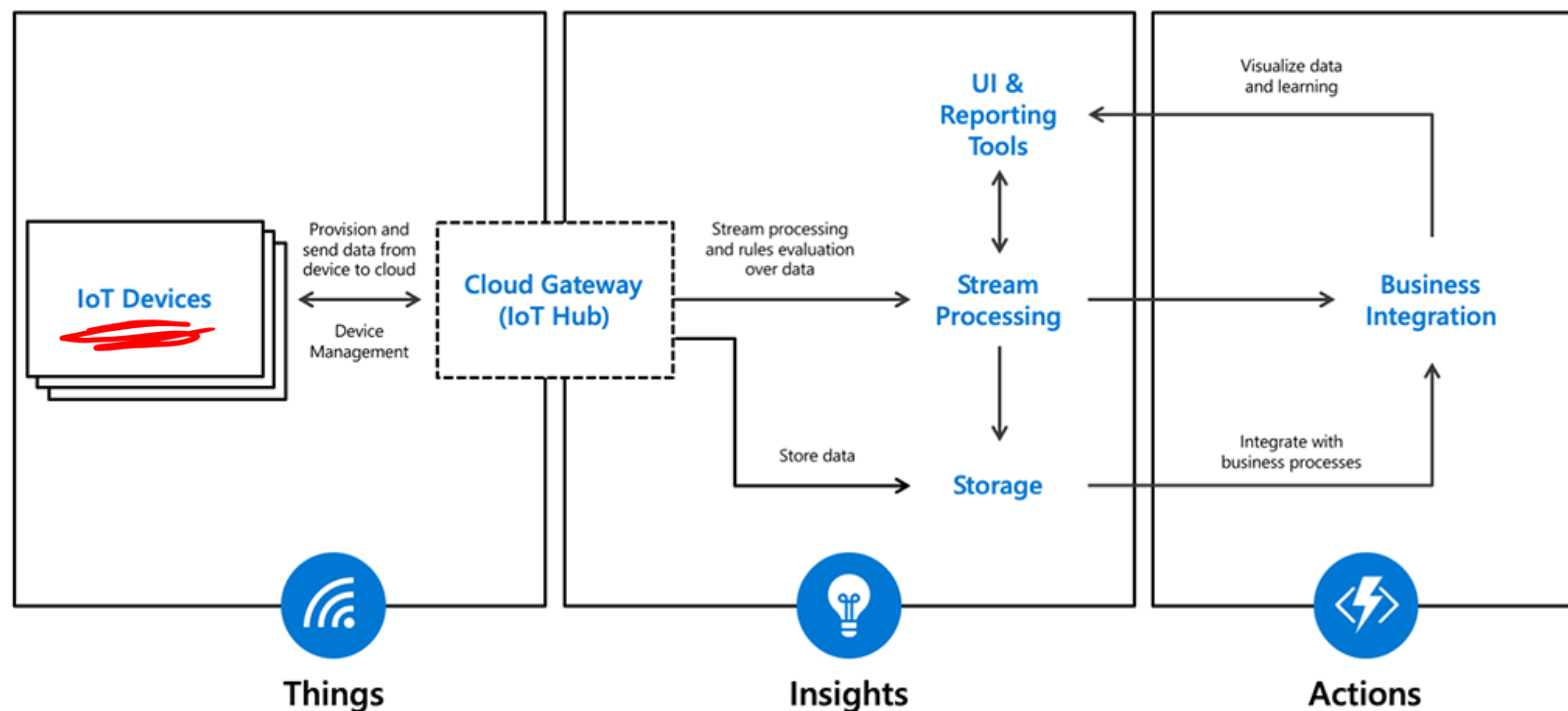

Central message hub for IoT applications and its attached devices.

When to use IoT Hub?

- Application complexity
- Data throughput
- Securing solution end to end allowing for per-device authentication
- Bi-directional communication

Capabilities over Event Hub:

- Per-device identity
- File upload from devices
- Device provisioning service

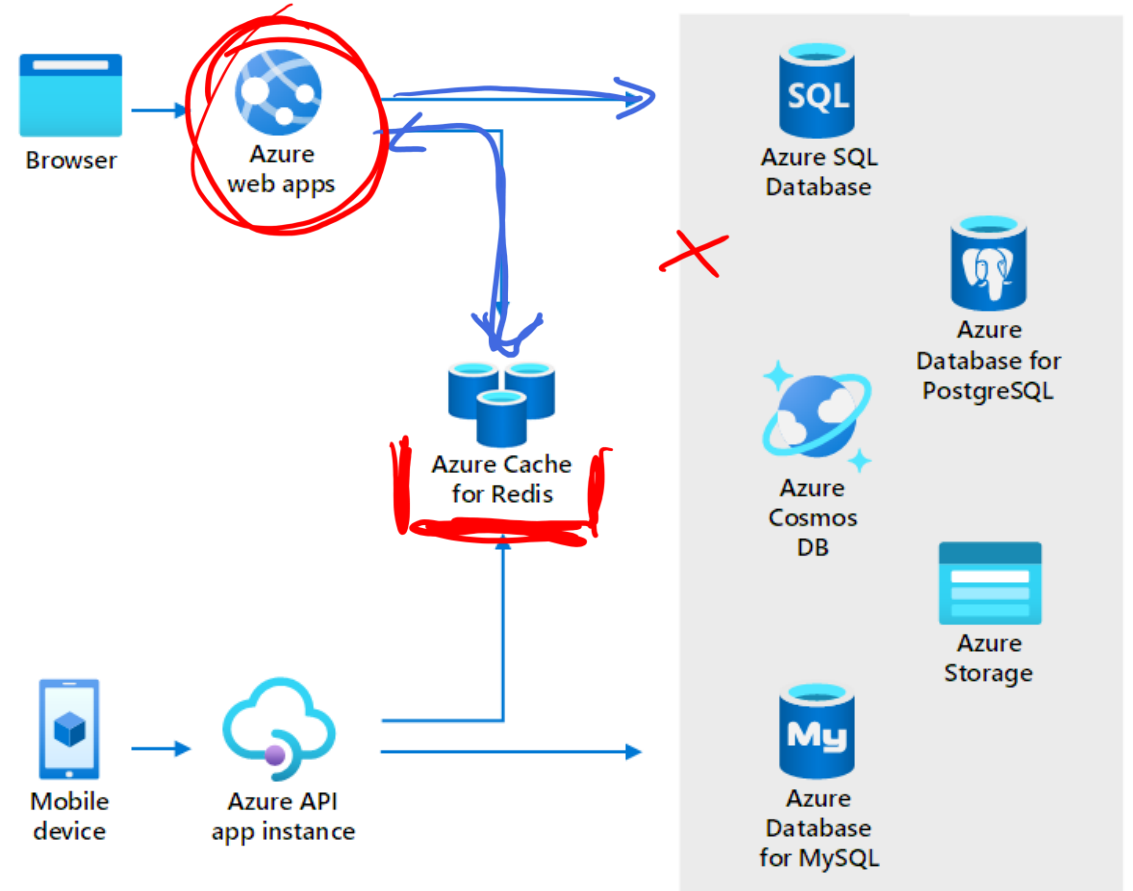

Design an application optimization solution

When to use Azure Cache for Redis

Store frequently accessed data so that applications can be responsive to users.

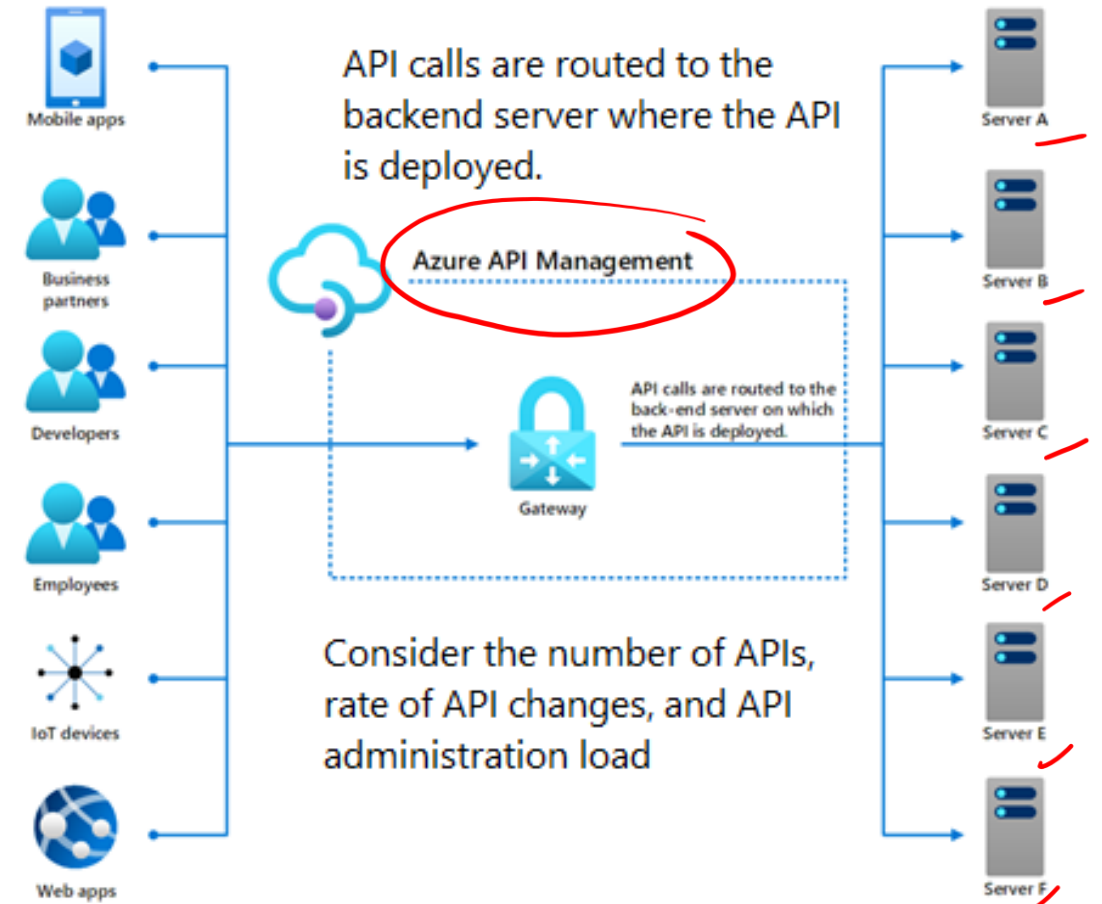

- Key scenarios - data cache, content cache, session store, job and message queuing, and distributed transactions
- Fully managed solution
- High availability - responds automatically to both anticipated and unanticipated changes in demand
- Same performance and scaling benefits throughout the world – network isolation, data encryption in transit

Design an Azure API management solution

Publish, secure, maintain, and analyze all your company's APIs.

- Bring multiple APIs under a single administrative umbrella – centralized management
- Manage permissions and access
- Ensure compliance across API
- Standardize API specs
- Protect the APIs from malicious usage

What is Infrastructure as Code?

Infrastructure as Code (IaC) is the process of automating your infrastructure provisioning.

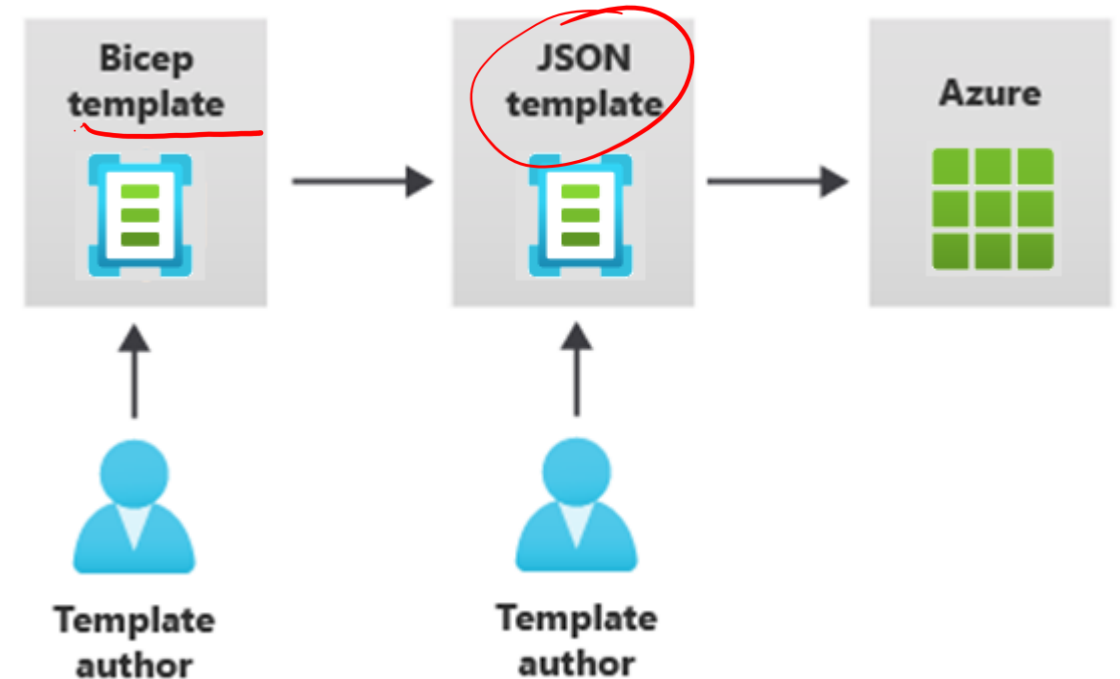

- The IaC model generates the same environment every time it is applied
- Solves the problem of environmental drift
- Enables teams to test applications in production-like environments early
- Where possible, uses declarative definition files

Provision resources with Infrastructure as Code

Azure supports IaC with Azure Resource Manager and third-party platforms.

- Azure Resource Manager templates – Bicep, JSON
- Azure Automation
- Azure DevOps services
- GitHub actions
- Terraform
- Jenkins

Design an Azure App Configuration solution

Azure App Configuration centrally manages application settings and feature flags.

- Flexible key representations and mappings
- Point-in-time replay of settings
- Dedicated UI for feature flag management
- Comparison of two sets of configurations on custom-defined dimensions
- Enhanced security through Azure-managed identities and encryption

Case study and review

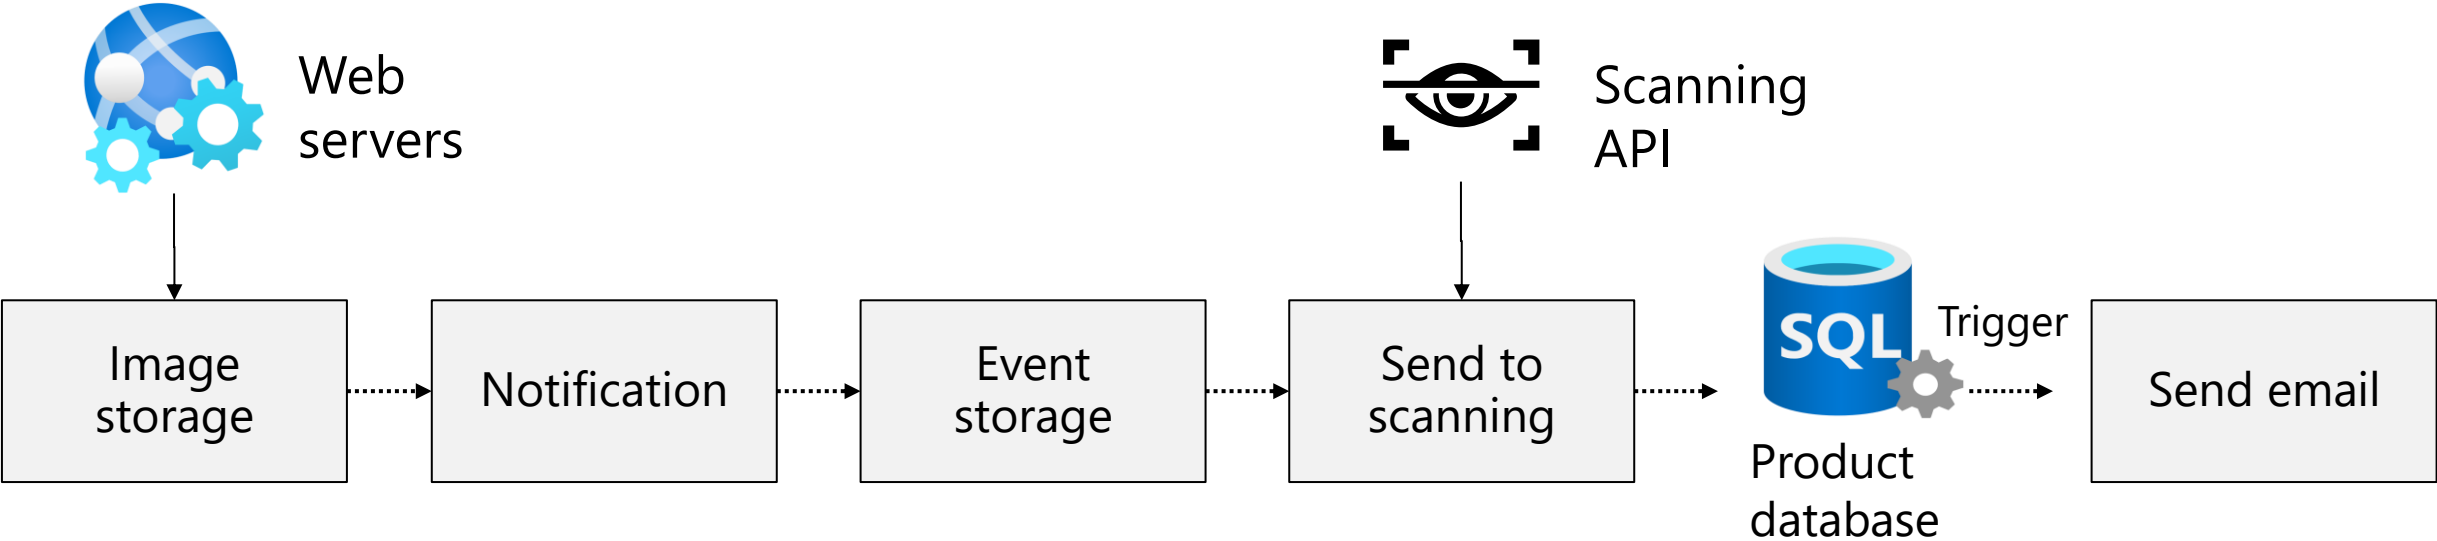

Case Study – Application architecture

A new product catalog design

- New product catalog, ordering process, and shopping cart
- Services will rely on a combination of relational and non-relational data
- It is critical that the service hosting the application supports rapid autoscaling and high availability

Instructor case study discussion

Event Grid

Function

Logic App

Blob

Automation

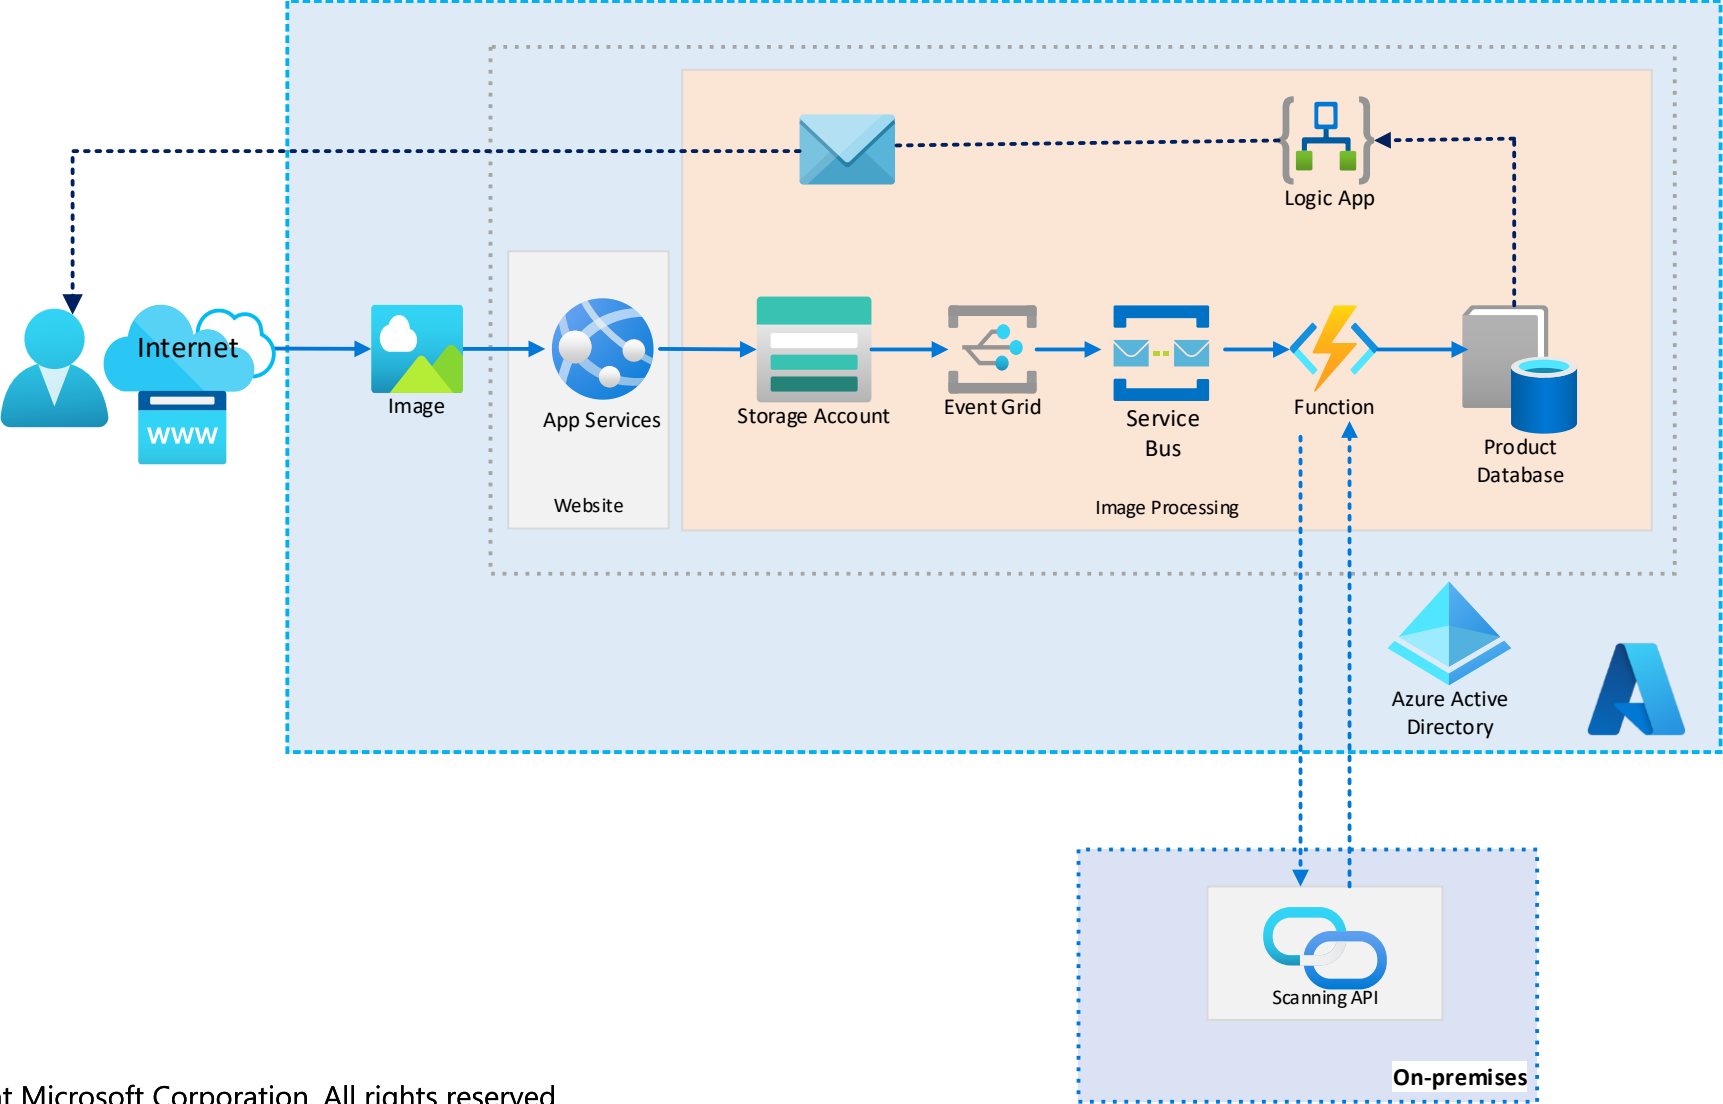

Service Bus

Queues
