AZ-305: Design Identity, Governance, and Monitoring Solutions (25-30%)

Design Authentication and Authorization Solutions

- Recommend a solution for securing resources with role-based access controls
- Recommend an identity management solution
- Recommend a solution for securing identities

Design Identities and Access for Applications:

- Recommend a solution that securely stores passwords and secrets
- Recommend solutions to allow applications to access Azure resources
- Recommend a solution for integrating applications into Azure AD
- Recommend a user consent solution for applications

# Design for identity and access management

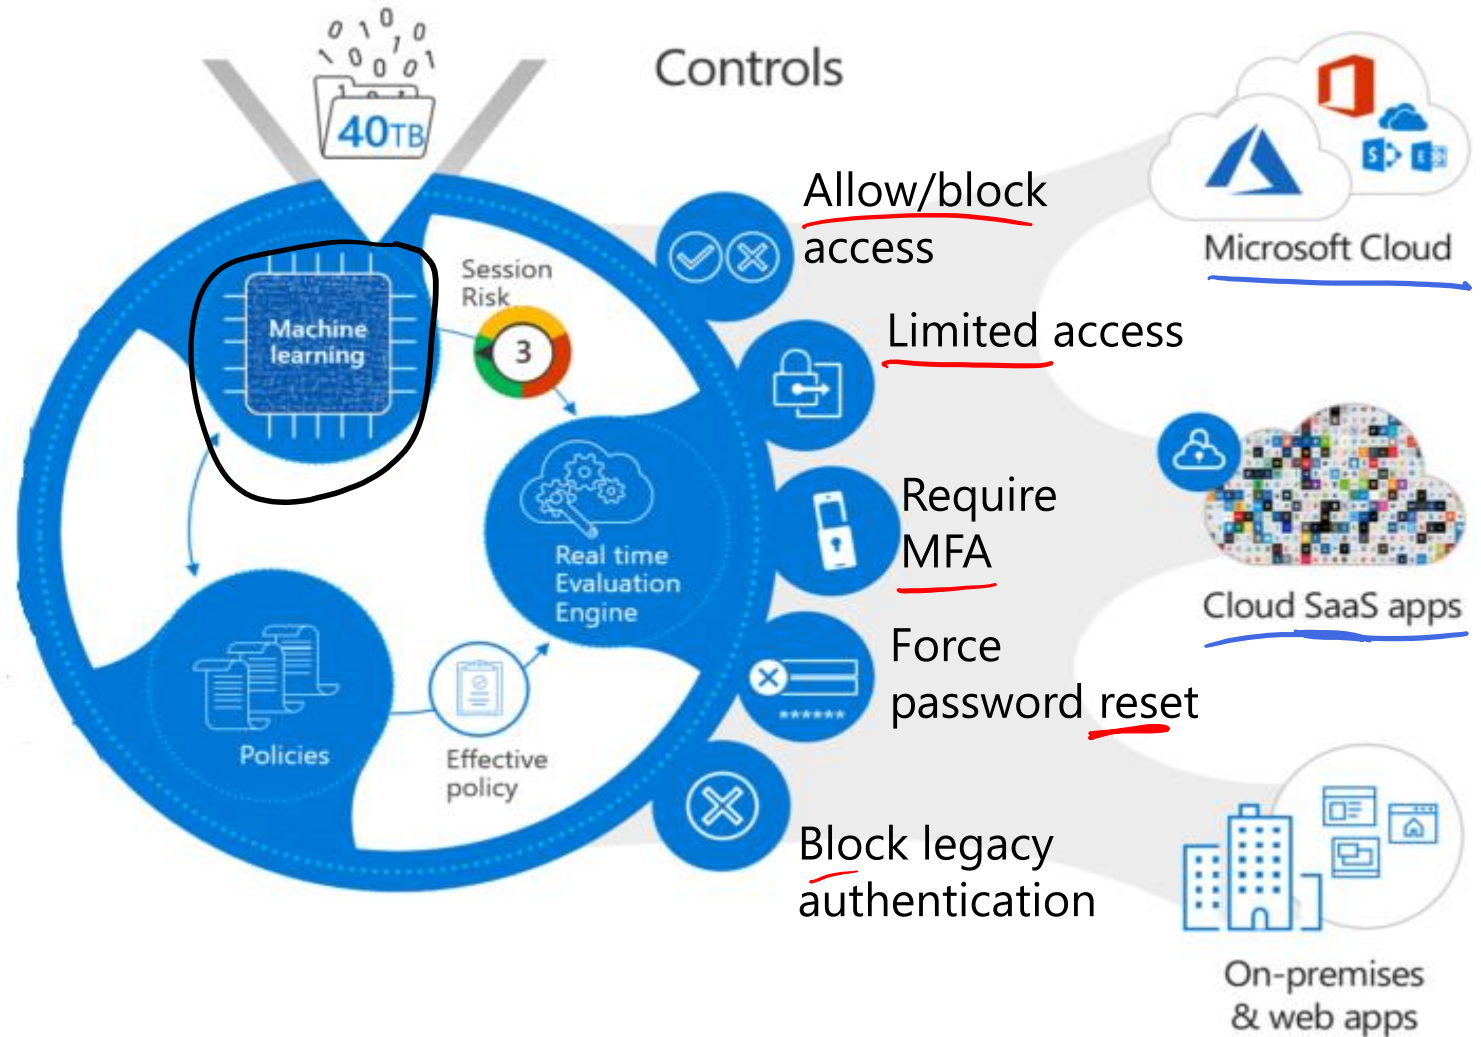

# Follow the Zero Trust model guidelines

Never trust, always verify.

~~Perimeter Network~~  
ID

- Employee and partner user and roles
- Trusted and compliant devices
- Physical and virtual location
- Client apps and authentication method

Conditions

# What is identity and access management

- Unified identity management
- Seamless user experience

- Allowed by role-based access control
- Verified by conditional access
- Monitored by Azure AD Identity Protection
- Confirmed by Azure AD access reviews

JWT  
OAuth OpenID Connect

If you need this	Use this
Provide identity and access management for employees in a cloud or hybrid environment.	Azure Active Directory (Azure AD) △
Collaborate with guest users and external business partners like suppliers and vendors.	Azure AD Business to Business (B2B) △ Trust
Control how customers sign up, sign in, and manage their profiles when they use your applications.	Azure AD Business to Consumer (B2C) <u>Token</u>

# Design for Azure Active Directory

# When to use Azure Active Directory

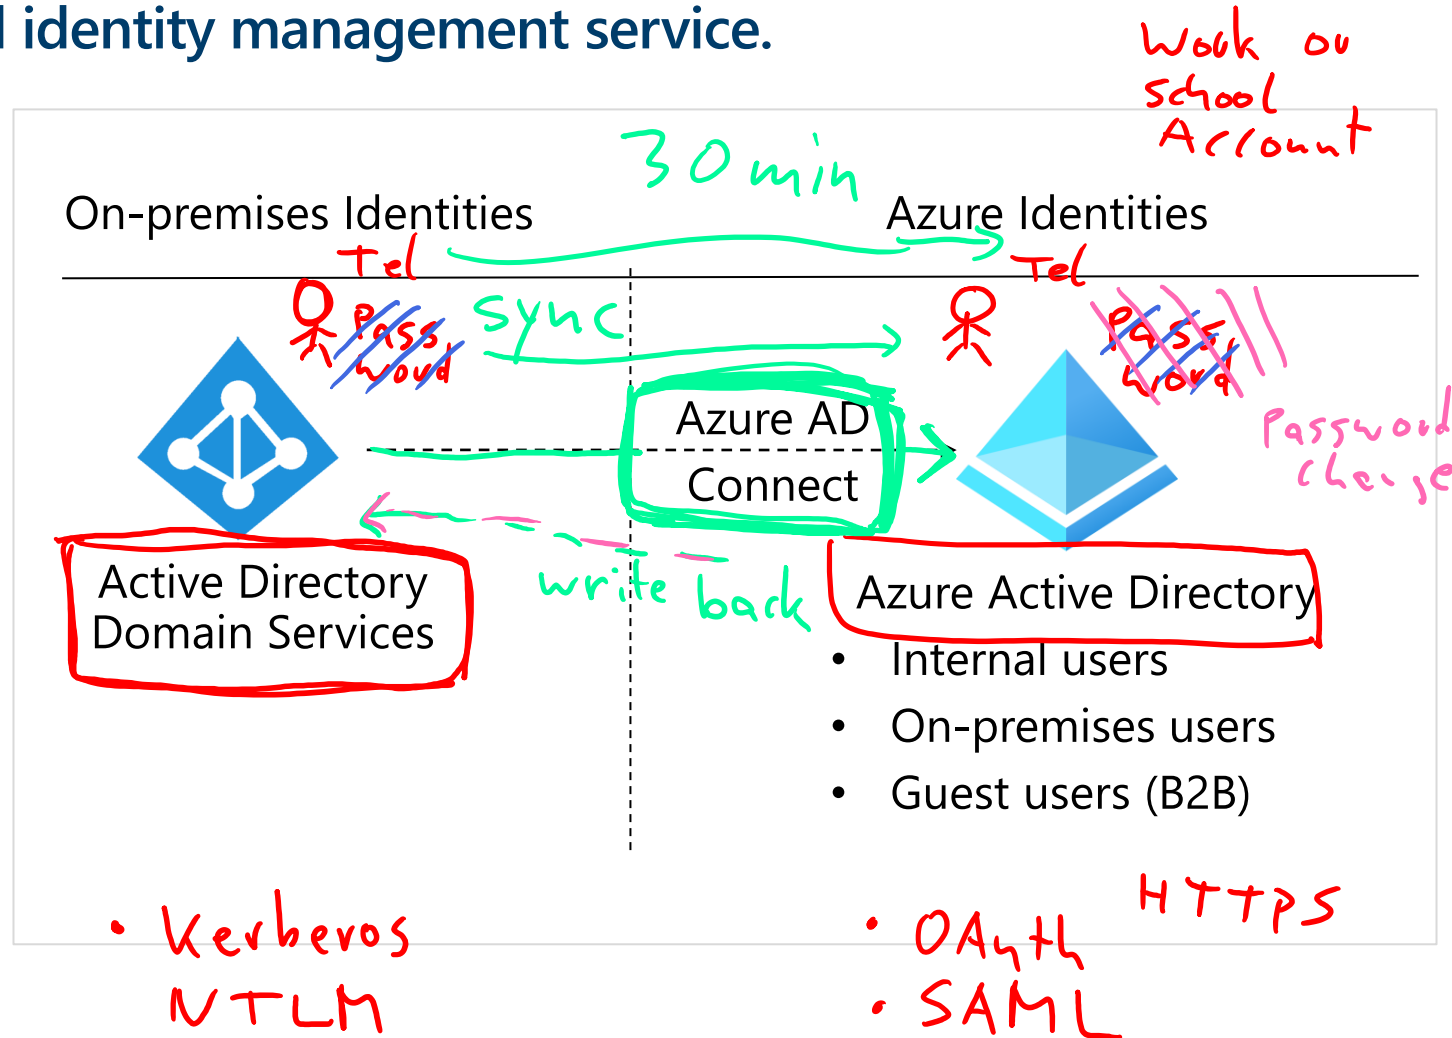

Azure AD is the Azure solution for identity and access management. Azure AD is a multitenant, cloud-based directory, and identity management service.

- Centralize identity management
- Establish a single Azure AD instance
- Use Azure AD Connect, or AD Connect cloud sync for hybrid identity sync

# Design for Azure AD Business to Business

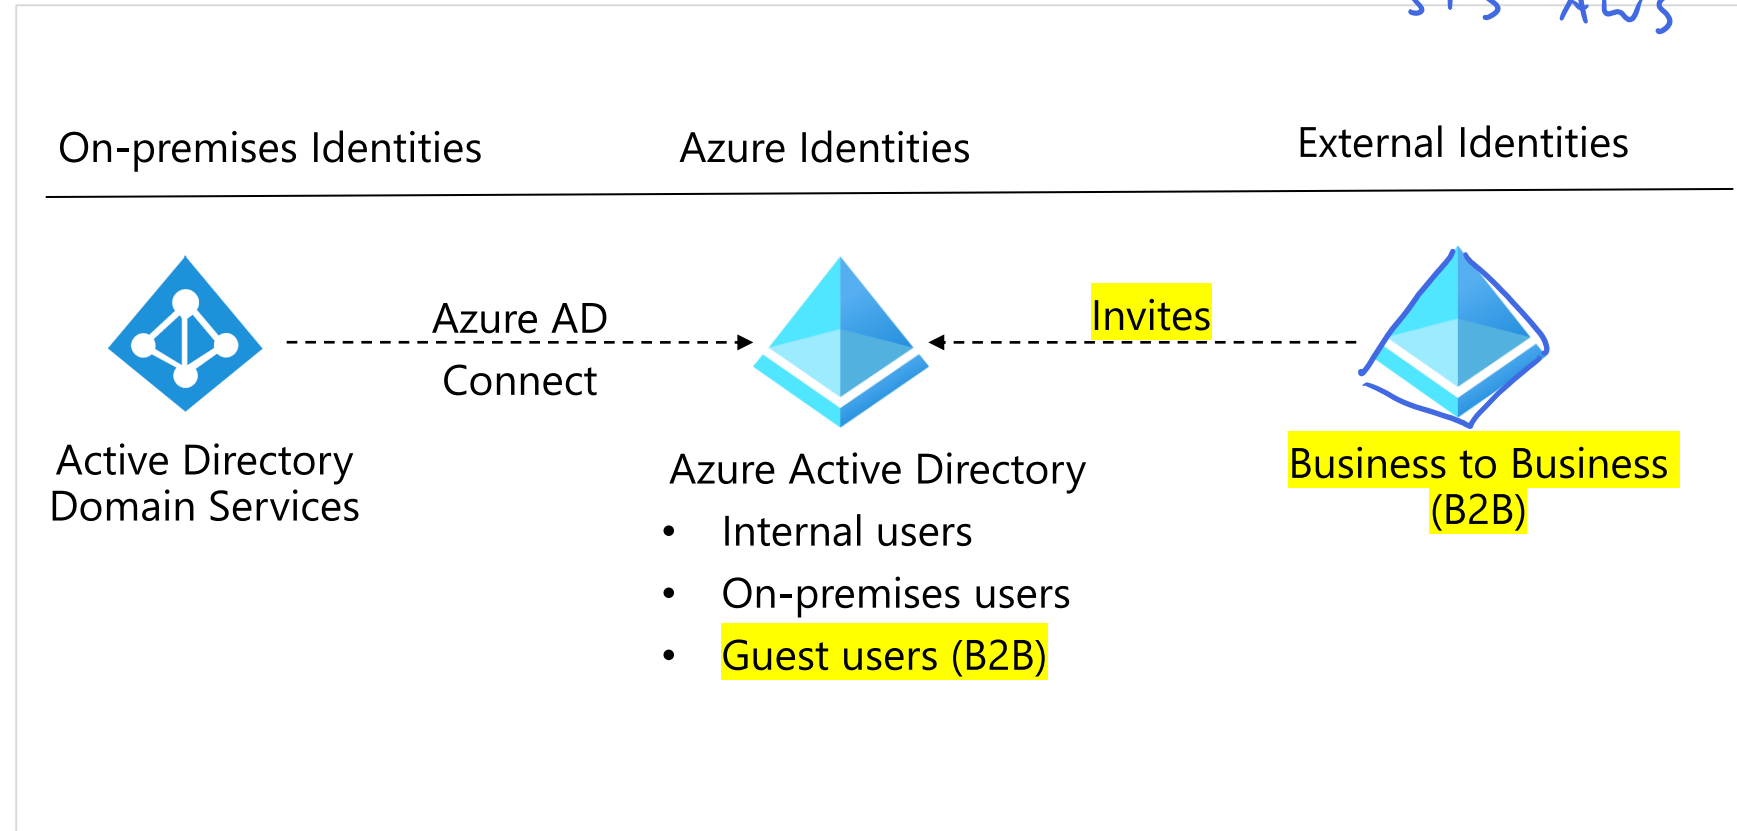

# When to use Azure AD Business to Business (B2B)

Azure AD B2B enables you to securely collaborate with external partners.

STS Facebook  
STS Google  
STS AWS

- Integrate with identity providers
- Use conditional access policies to intelligently grant or deny access
- Require MFA for guest users

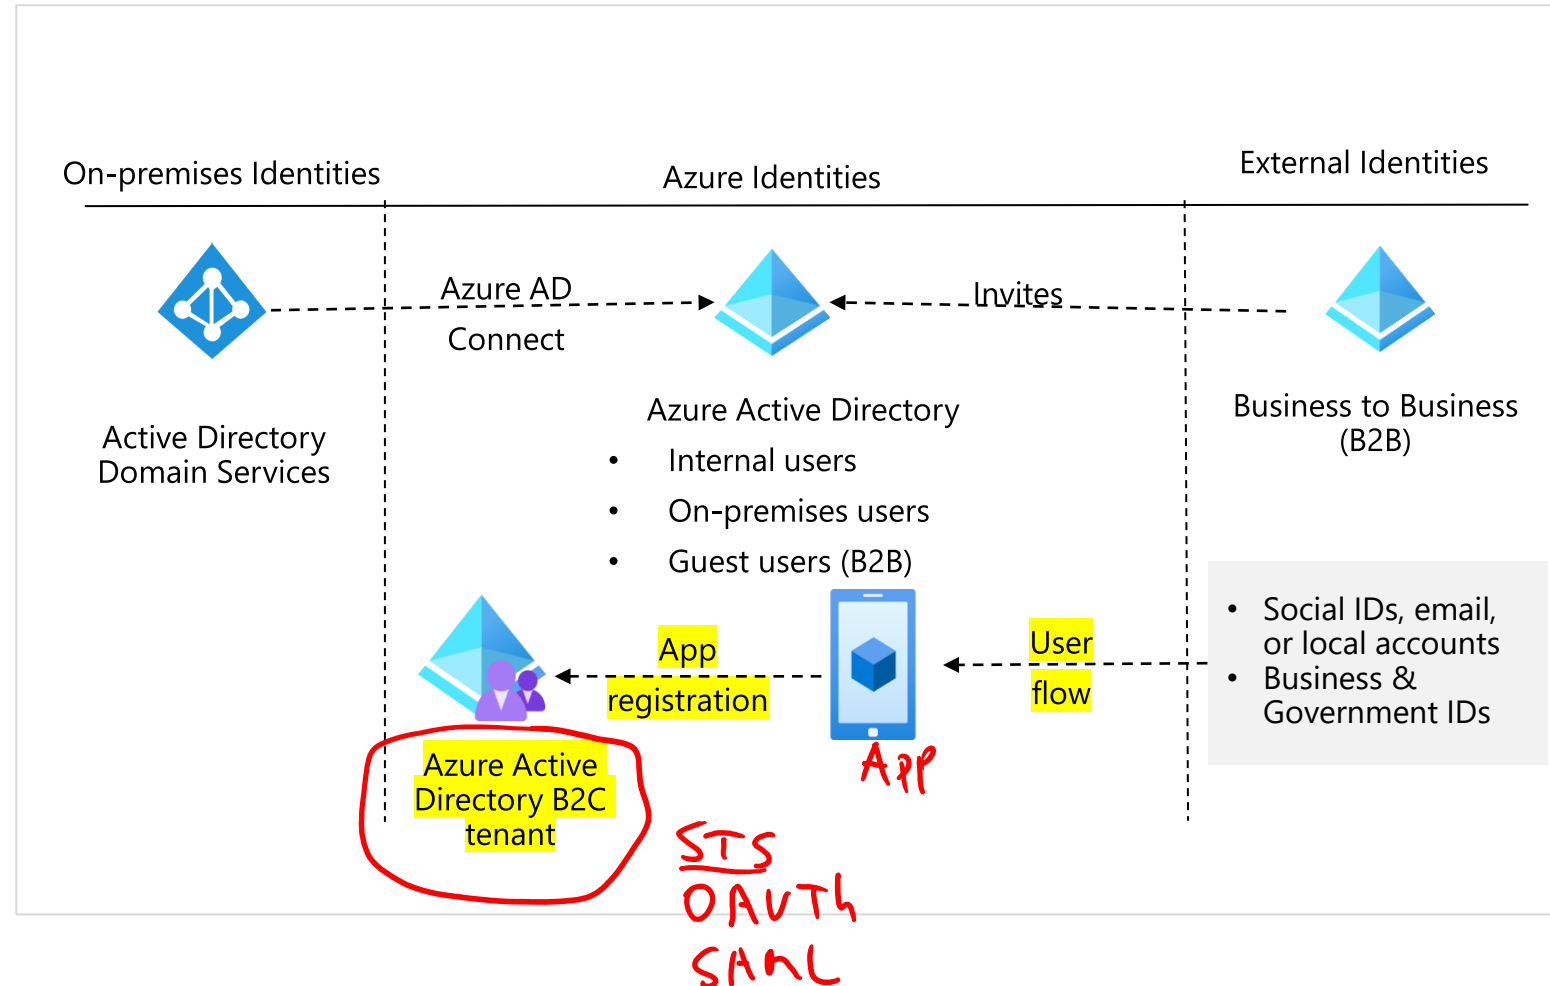

# Design for Azure AD Business to Customer

# When to use Azure AD Business to Customer (B2C)

Azure AD B2C is a type of Azure AD tenant that you use to manage customer identities and their access to your applications.

- Integrate with external user stores
- Provide single sign-on access with a user-provided identity
- Create a custom-branded identity solution
- Use policies to configure user journeys
- Use progressive profiling to gradual collect user information
- Pass user data to a 3<sup>rd</sup> party for validation

# Compare solutions (activity)

- Customers cannot be viewed by other users
- Users are managed in a separate Azure AD directory
- Users need to be able to self-signup for accounts
- Users manage their own profiles
- Users can come from SAML and WS-Fed based identity providers

# Design for conditional access

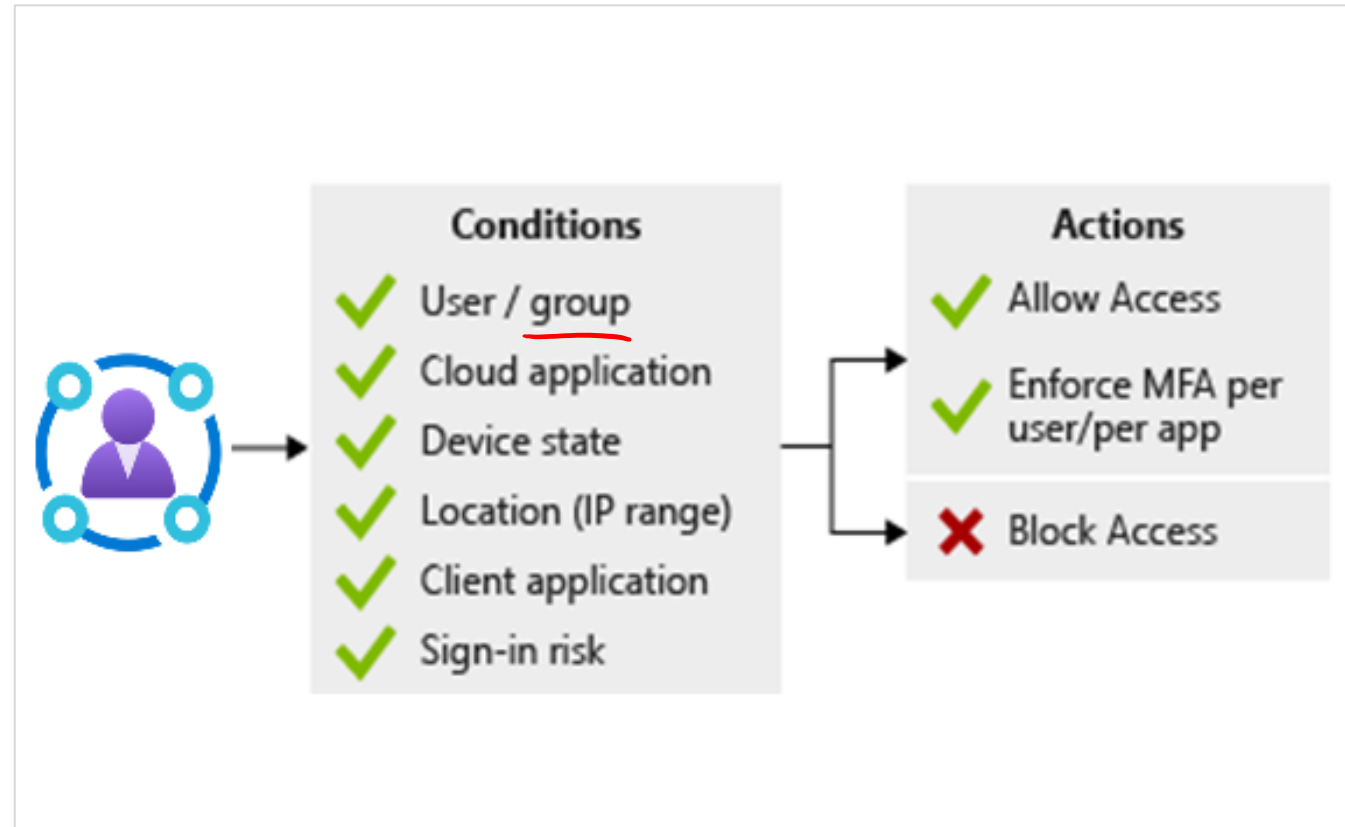

# When to use conditional access

P2  
100x 90 Tage

Conditional Access is an Azure AD tool that allows (or denies) access to resources.

- Use to enable multifactor authentication
- Require managed devices
- Access only approved client applications
- Exclude countries from which you never expect a sign in
- Respond to potentially compromised accounts.
- Completely block access
- Block legacy authentication protocols.
- Test using the report-only mode

- 1) Cond Access
  - 2) ID Protection
  - 3) Privilege Id Management
- PIM Workflow  
GIT  
P2

## Design for identity protection

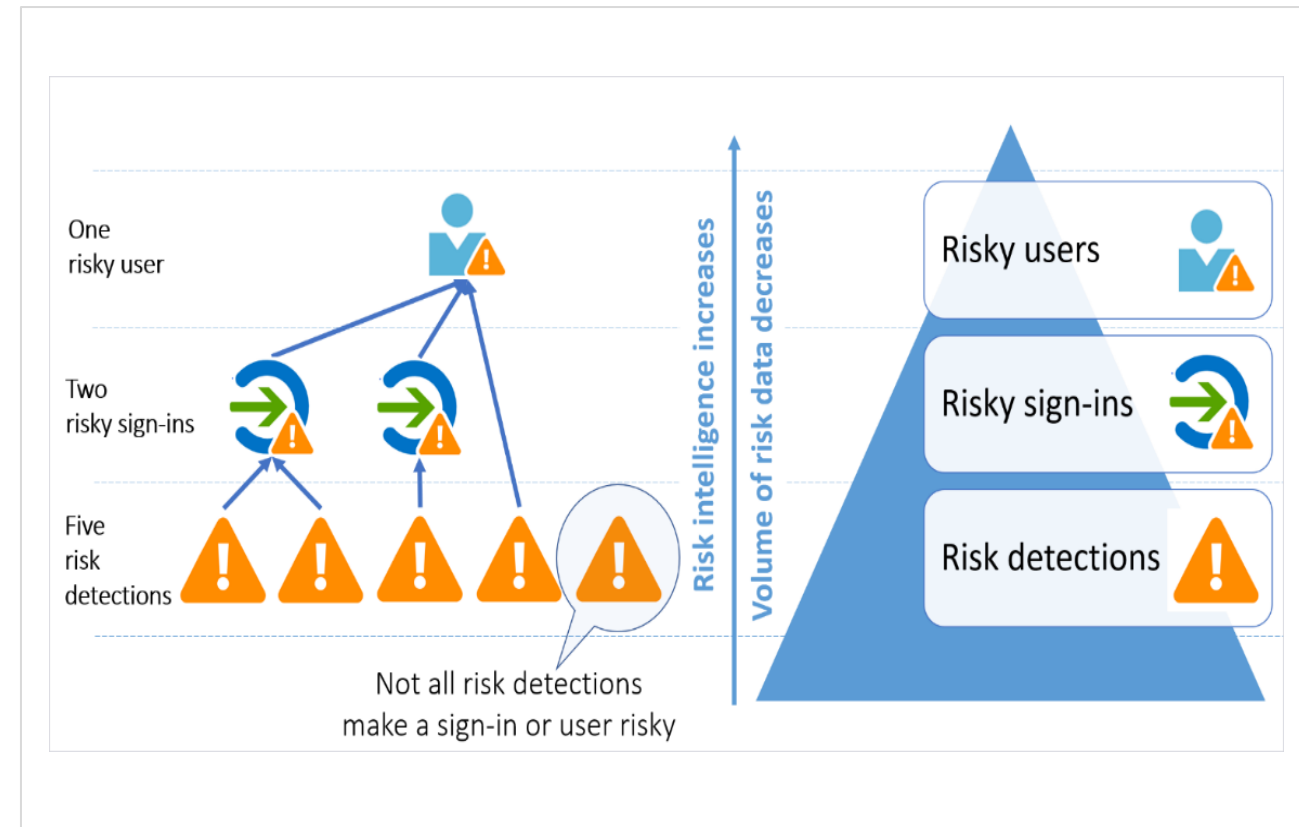

# When to use identity protection

? TOR  
Travel

Identity protection is an Azure AD tool that automates the detection and remediation of identity-based risks.

- Configure the policies and actively review the results
- Set the sign-in risk policy to Medium and above and allow self-remediation options
- Set the user risk policy threshold to High
- Allow for excluding users - emergency access or break-glass administrator accounts
- Send data to Conditional Access or other security information and event management (SIEM) tool

# Design for access reviews

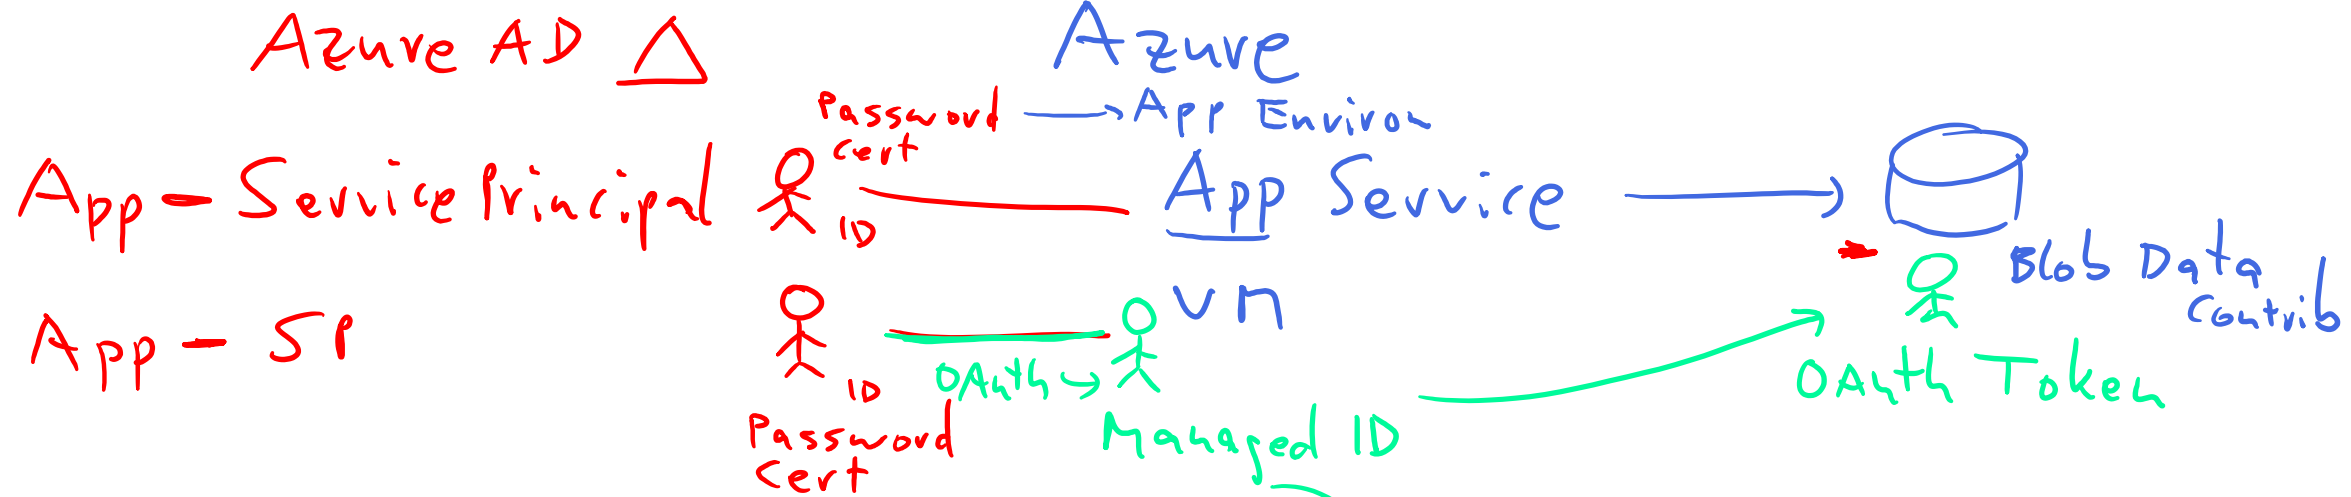

# When to use access reviews

Access reviews are an Azure AD tool to review user access and ensure they should have continued access to resources.

- Determine the purpose of the access review
- Engage the right stakeholders
- Create an access review plan
- Determine who will conduct the reviews
- Decide who can self-attest access
- Determine what resource types will be reviewed
- Start small – pilot your plan – keep people informed

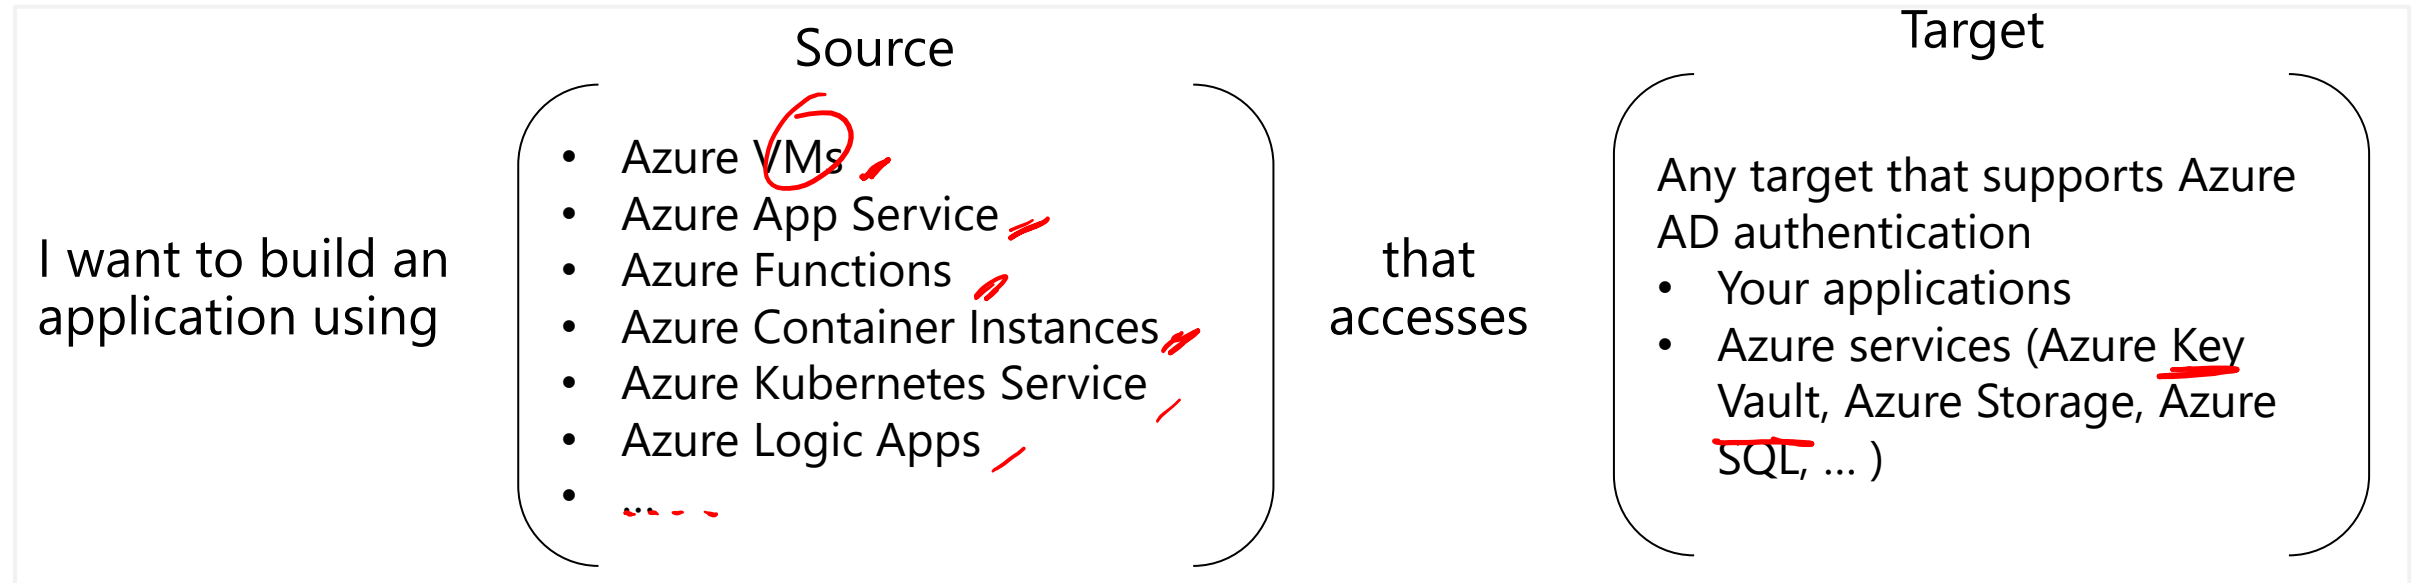

# Design service principals for applications

# Design managed identities

Managed identities provide an identity for application authentication.

- The source is an Azure resource
- The target supports Azure AD authentication and Azure RBAC
- No credential rotation or certificate management

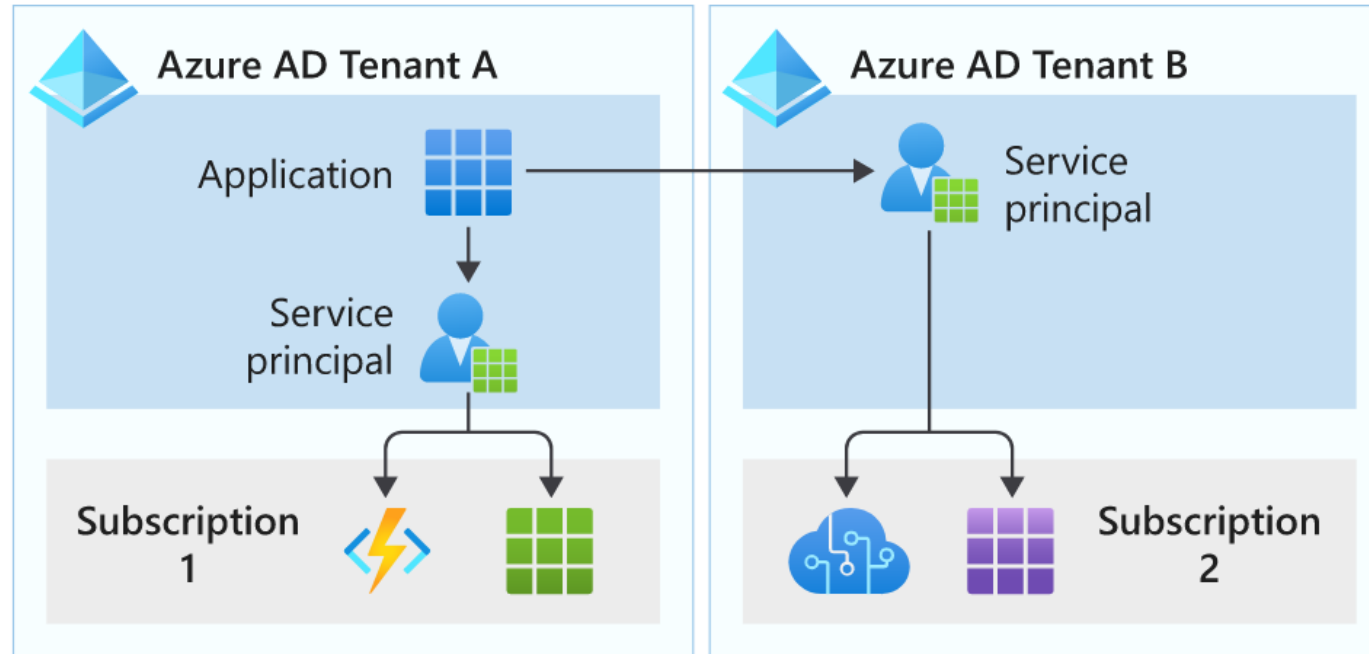

$\begin{matrix} 0 \\ * \\ 1 : N \end{matrix}$ 
 $\begin{matrix} \cancel{VA_1} \\ \cancel{VA_2} \\ SQ_3 \end{matrix}$

~~V1~~  
~~V2~~  
~~SQ1~~ 3

# Select application service principals

This type of service principal is the local representation, or application instance, of a global application object in a single tenant or directory

Useful when Managed Identities cannot be used

Authentication is performed by the application using a secret or certificate

Often used to authenticate external applications to Azure resources

# Best practices for requesting permissions

When building an app that uses Azure AD to provide sign-in and access tokens for secured endpoints, there are a few good practices you should follow.

When registering an application in AAD, consider business and security needs of admin consent versus user consent

---

Only ask for the permissions required for implemented app functionality. Don't request user consent for permissions that you haven't yet implemented for your application.

---

In addition, when requesting permissions for app functionality, you should request the least-privileged access.

---

Apps should gracefully handle scenarios where the user doesn't grant consent to the app when permissions are requested.

# Design for Azure Key Vault

Azure Key Vault provides a secure storage area for managing all your app secrets so you can properly encrypt your data in transit or while it's being stored.

Standard  
Premium HSM ← Bring your own key On Prem KV

## Why use Key Vault?

- Separation of sensitive app information from other configuration and code, reducing the risk of accidental leaks.
- Restricted secret access with access policies tailored to the apps and individuals that need them.
- Centralized secret storage, allowing required changes to happen in only one place.
- Access logging and monitoring to help you understand how and when secrets are accessed.
- Implementing Customer Managed Keys for Azure services

## When to consider multiple Key Vaults:

- RBAC vs Policies
- Performance

# Review

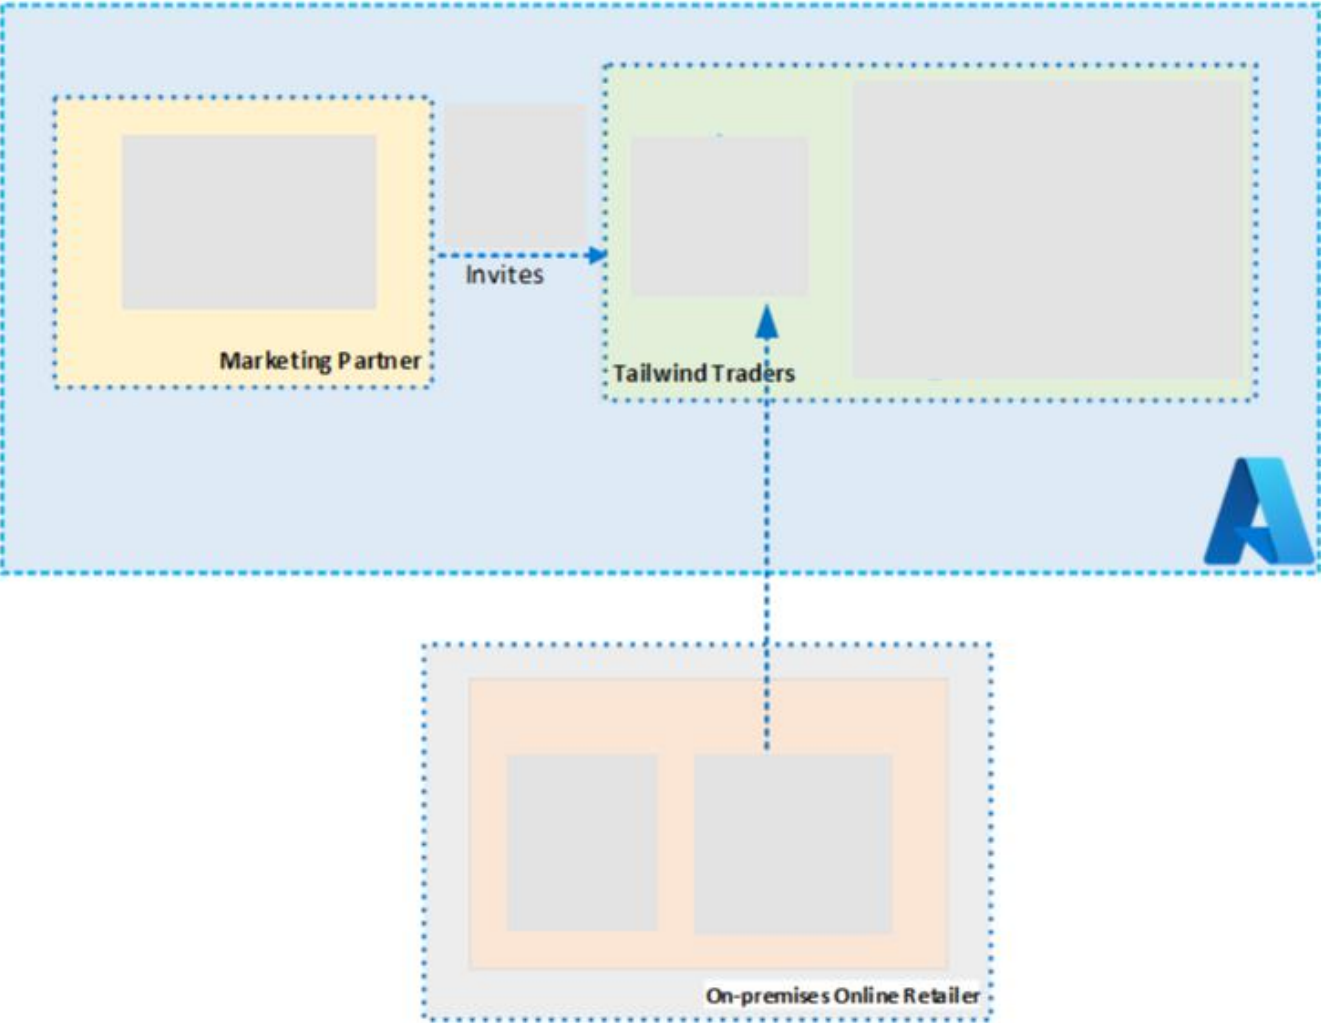

# Case Study – Authentication and authorization

1. A company acquisition will add 75 employees – new user accounts
2. New employees are in different geographic regions – new identity protection policies
3. New application with a SQL database – access solution
