

AZ-305

Guten Morgen!

Designing Microsoft Azure Infrastructure Architect

AZ-900

AZ-305 Agenda

Module 01 Design a governance solution

Module 02 Design a compute solution

Module 03 Design a non-relational data storage solution

Module 04 Design a data storage solution for relational data

Module 05 Design a data integration solution

Module 06 Design an application architecture solution

Module 07 Design Authentication and Authorization Solutions

Module 08 Design a solution to log and monitor Azure resources

Module 09 Design a network infrastructure solution

Module 10 Design a business continuity solution

Module 11 Design a migration solution

+ Topics

Introduction

- Design for data storage
- Design for Azure storage accounts
- Design for data redundancy
- Design for Azure blob storage
- Design for Azure files
- Design an Azure disk solutions
- Design for storage security
- Case study
- Summary and resources

AZ-305: Design Data Storage Solutions (25-30%) Design a Data Storage Solution for Non-relational Data

- Recommend access control solutions to data storage
- Recommend a data storage solution to balance features, performance, and cost
- Design a data solution for protection and durability

Design for data storage

**1010
1010**

SQL → NoSQL

Classify your data storage

To design Azure storage, you first must determine what type of data you have.

- **Structured data** includes relational data and has a shared schema *Table*
- **Semi-structured** is less organized than structured data and isn't stored in a relational format
- **Unstructured data** is the least organized type of data

Design for Azure storage accounts

Kudu

Determine the best storage account type

Select an account type based on supported services, usage cases, and SLA.

Kusto QL
↑

Log Analytics WS

Account Type	Supported services	Usage
<u>Standard general-purpose v2 (default)</u>	Blobs / <u>Data Lake</u> , Queues, Tables, Azure Files	Recommended for most scenarios
Premium block blobs /	Blob storage, <u>Data Lake</u>	High transactions rates, single digit storage latency, or large numbers of <u>small transactions</u>
Premium file shares /	Azure Files	Enterprise or high-performance scale applications - supports both SMB and NFS file shares
Premium page blobs /	Page blobs only	High performance and low <u>latency</u> storage scenarios

Considerations for storage accounts

It is important to plan your storage accounts.

LA workspace

Location

For performance reasons locate the data close to users. One storage account for each location.

Compliance

Regulatory guidelines for keeping data in a specific location / Internal requirements for auditing or storing data.

Cost

The settings for the account do influence the cost of services in the account.

Replication

Data storage could have different replication strategies.

Administrative overhead

Each storage account requires some time and attention from an administrator to create and maintain.

Security - Data sensitivity

Data plane security and data storage security.

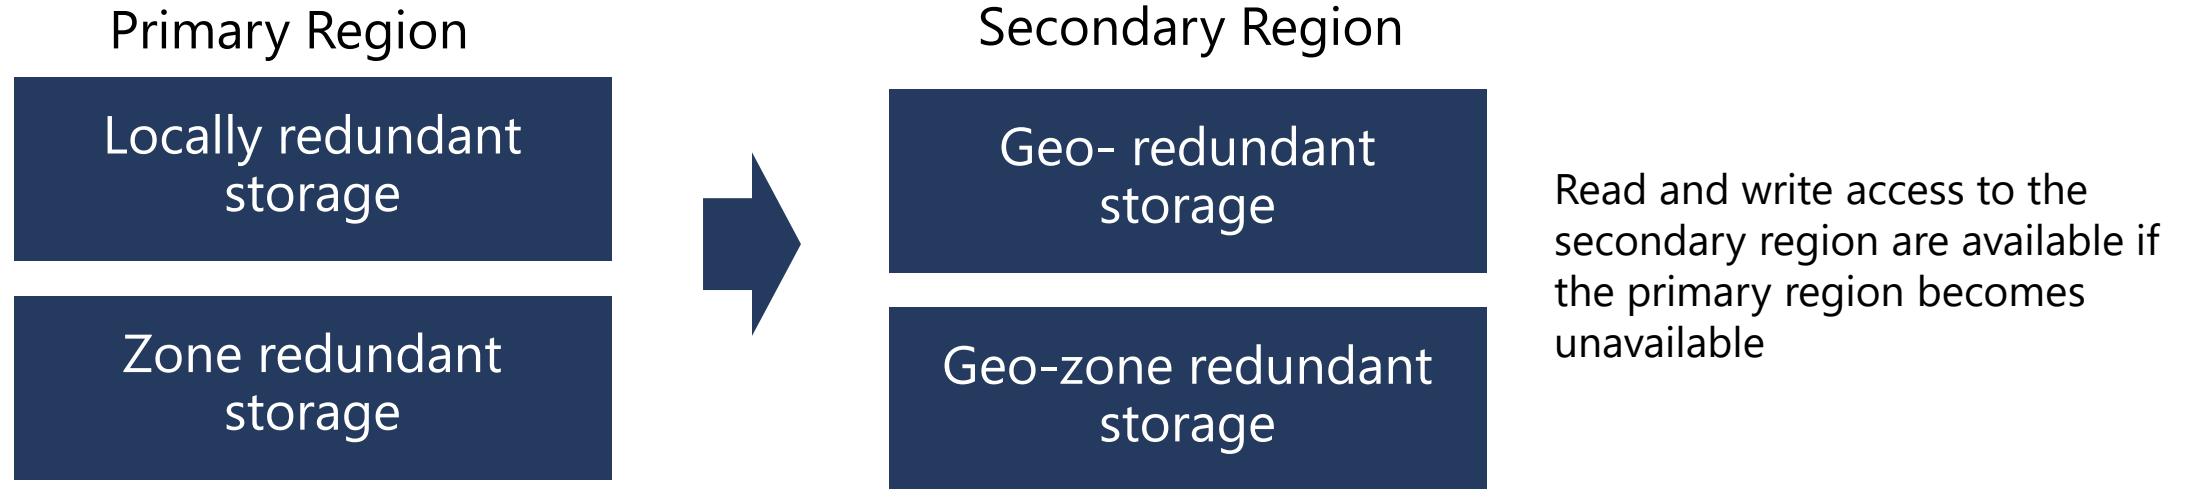

Design for data redundancy

Select a storage replication strategy

What level of redundancy do you need?

- A node within a data center becomes unavailable
- An entire data center (zonal or non-zonal) becomes unavailable
- A region-wide outage occurs in the primary region

Design for Azure blob storage

Determine the storage tier

Blob storage is an object store used for storing vast amounts of unstructured data.

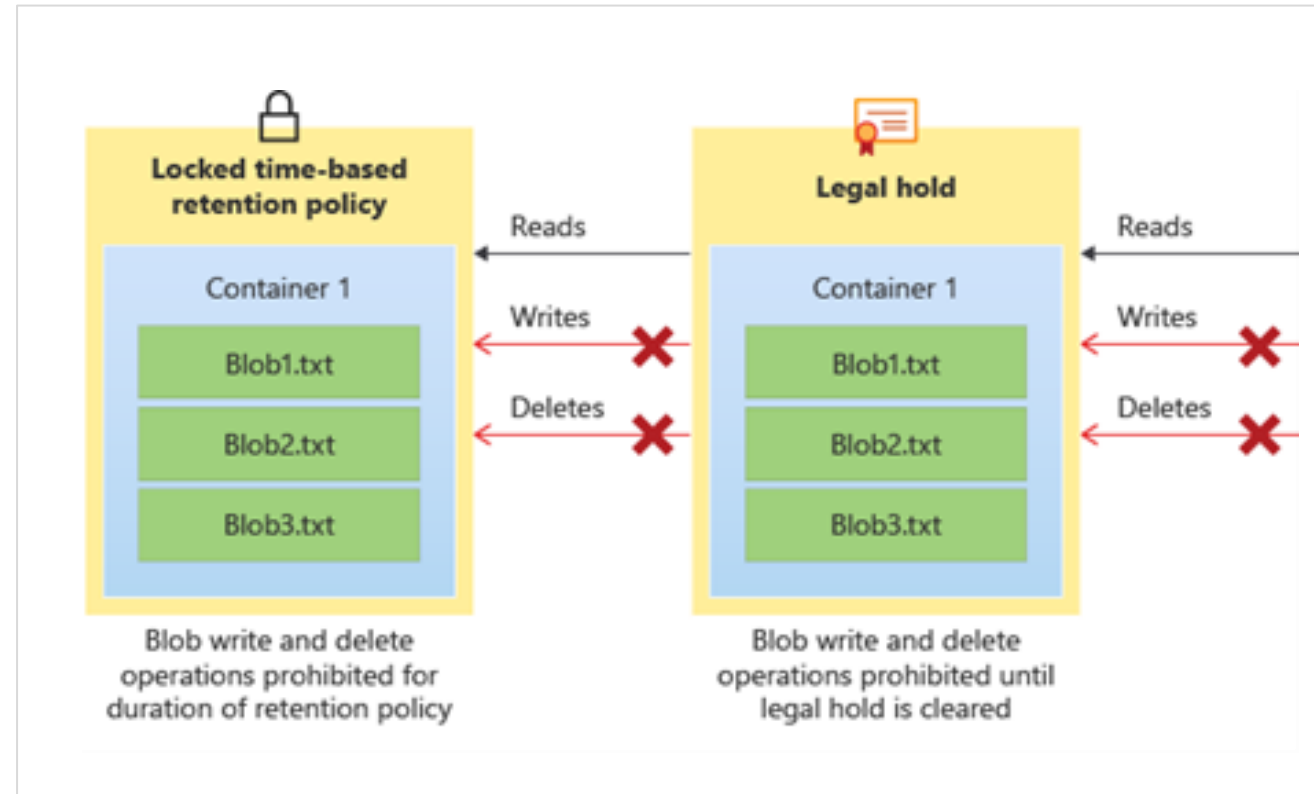

Tier	Storage Costs	Retrieval/Read Costs	Storage Duration	Usage cases
Premium	High	Lowest	N/A	<ul style="list-style-type: none">High throughput and large numbers of I/O operations per second
Standard <u>Hot</u>	Medium	Low	N/A	<ul style="list-style-type: none">Active and frequent useData staged for processing
Standard <u>Cool</u>	Low	Medium	> 30 days	<ul style="list-style-type: none">Short-term backupOlder media infrequently viewedLarge data sets
Standard Archive	Lowest	High	> 180 days	<ul style="list-style-type: none">Long-term backupOriginal (raw) dataCompliance or archival data

- Use lifecycle rules to transition blob data to the appropriate access tiers
- Consider a data lifecycle rule to expire or delete data

Consider immutable storage policies

Determine regulatory compliance, secure document retention, and legal hold policies.

- Apply immutable storage policies at the container level
- Use **time-based retention policies** for business-critical data
- Use **legal-hold policies** for sensitive information to ensure a tamper proof state
- Policies apply only to new content
- Audit logs are available

Design for Azure files

Select a file storage tier (activity)

Tailor your file tiers to the performance and price you need

File storage tiers
Premium
Transaction optimized
Hot
Cool

You have highly I/O-intensive workloads, with high throughput and low latency

You need storage optimized for general purpose file sharing scenarios such as team shares and Azure File Sync

You need cost-efficient storage optimized for online archive storage scenarios

You have transaction heavy workloads and applications that require file storage and backend storage

Design for NetApp files

The Azure NetApp Files service is enterprise-class, high-performance, metered file storage.

- Ease of migration
- Workload scale
- Flexibility
- Storage technology

Migration (Windows Apps & SQL Server | Linux OSS
Apps & Databases | SAP on Azure)

Specialized workloads (HPC | VDI | AVS)

Azure Platform Services (AKS, Azure Batch, ...)

Azure NetApp Files (Enterprise NAS)

Design an Azure disk solution

Select an Azure disk solution

Azure disks are block-level storage volumes used with Azure virtual machines.

- Consider disk type, scenario, throughput, and IOPS
- Always use managed disks
- Optimize read and write access with disk caching
- Use Azure Disk Encryption
- Enhance performance with multiple disks
- Use the network acceleration feature
- Share disks across multiple VMs

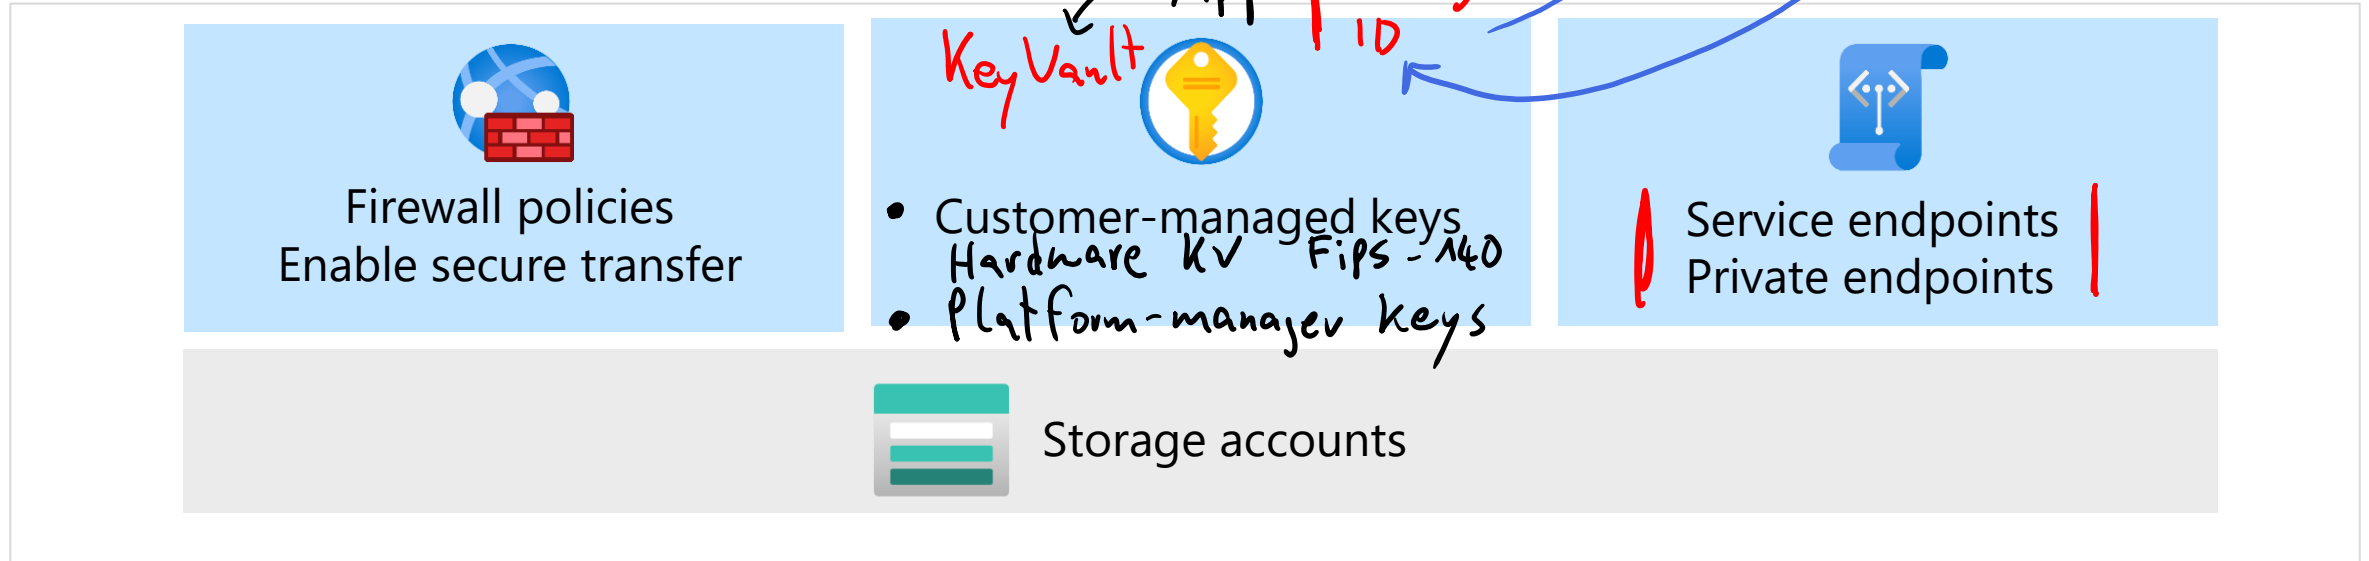

Disk type	Usage cases
Ultra-disk SSD	IO-intensive workloads such as SAP HANA, top tier databases (SQL, Oracle), and other transaction-heavy workloads
Premium SSD v2	Production and performance-sensitive workloads that consistently require low latency and high IOPS and throughput
Premium SSD	Production and performance sensitive workloads
Standard SSD	Web servers, lightly used enterprise applications and dev/test
Standard HDD	Backup, non-critical, infrequent access

Design for storage security

Considerations for storage security

Use a layered security model to secure and control access.

- Grant limited access to Azure Storage resources
- Enable firewall rules to limit access to access - IP addresses or subnets
- Use private endpoints and private links for clients
- Use virtual network service endpoints to provide direct connection
- Use customer managed encryption keys

Case study and review

Case study – Non-relational data

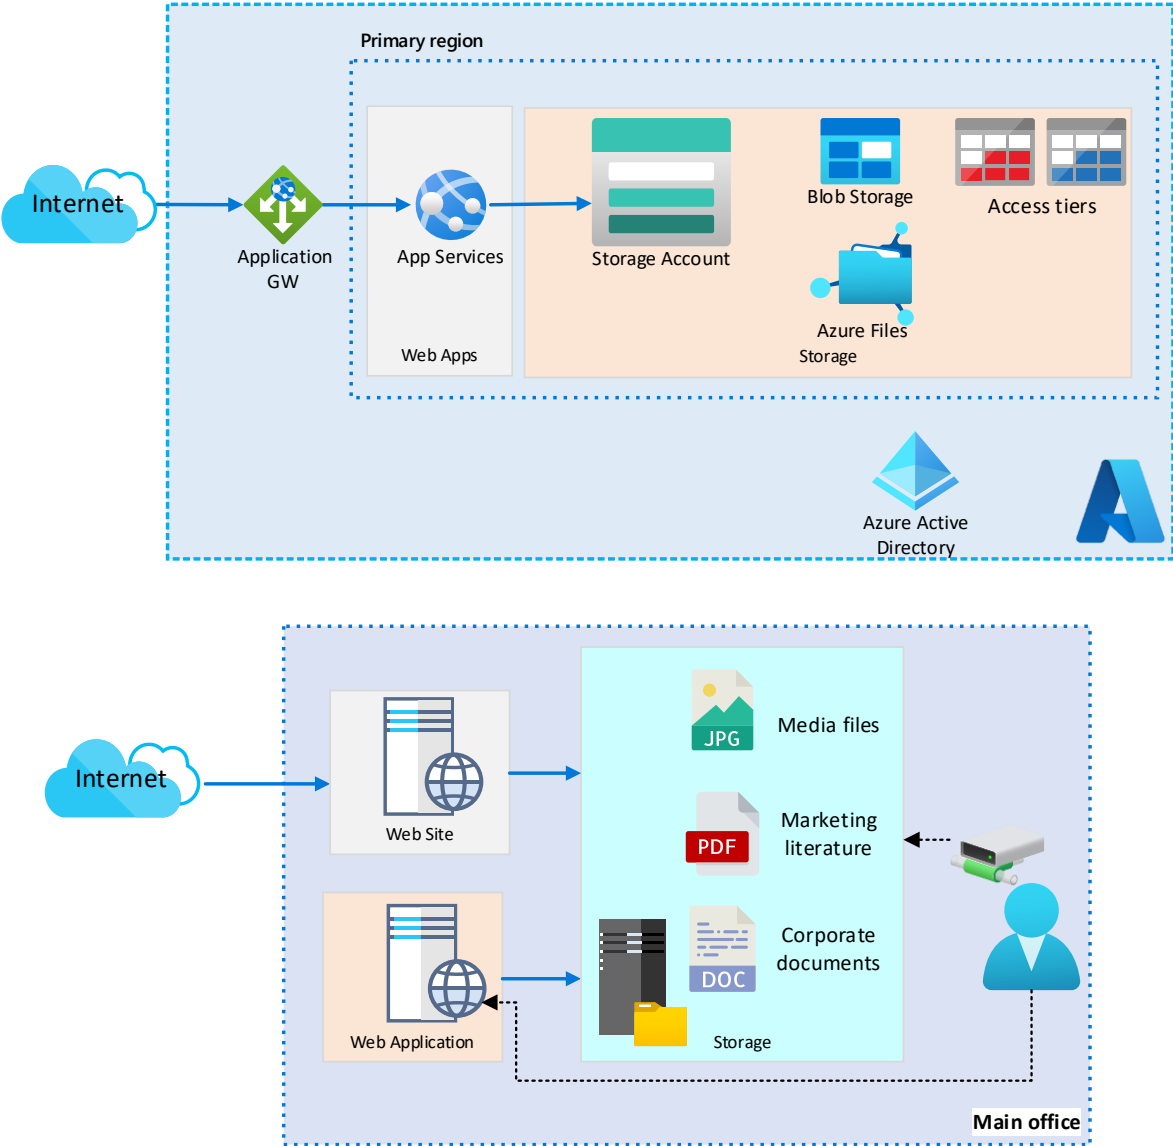

Media files	Marketing literature	Corporate documents
<ul style="list-style-type: none">• Product photos and feature videos• JPEG and MP4 are most common formats	<ul style="list-style-type: none">• Customer stories, sales flyers, sizing charts, and eco-friendly manufacturing information• PDF format is the most common	<ul style="list-style-type: none">• Internal documents – some sensitive• Mostly Office formats like Word and Excel

Case study discussion

- Design a storage solution for Tailwind Traders.
 - What type of data is represented?
 - What factors will you consider in your design?
 - What type of storage accounts are needed?
 - Will you use blob access tiers?
 - Will you use immutable storage?
 - How will the content be securely accessed?
- Your solution should consider the media, marketing literature, and corporate documents.
